(INFN – LNF),

# Outline

- Introduction of the LEMMA project
- Numerical simulation of the deposited energy onto the target
- Temperature behaviour of the thermal parameters of Beryllium and Carbon
- Temperature field after a single bunch – temperature temporal evolution
- Target steady state temperature
- Thermal stress and quality factors to prevent target fractures
- Conclusions

# Introduction of the LEMMA project

## Low EMittance Muon Accelerator

**Universities: Sapienza, Padova, Insubria**

**Contributions from: CERN, ESRF, LAL, SLAC**

- A  $\mu^+\mu^-$  collider offers an ideal technology to extend lepton high energy frontier in the multi-TeV range:
  - No synchrotron radiation (limit of  $e^+e^-$  circular colliders)
  - No beamstrahlung (limit of  $e^+e^-$  linear colliders)
  - but muon lifetime is 2.2 ms (at rest)

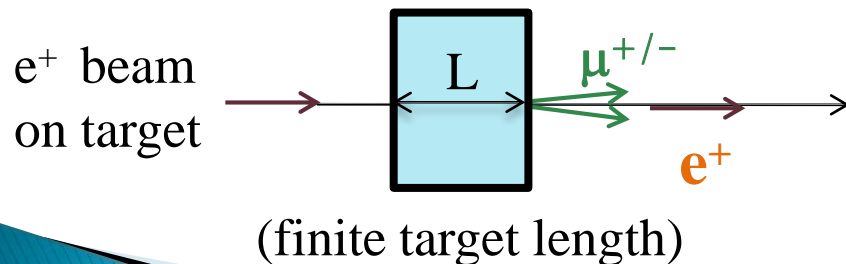

# Muon source

$e^+e^-$  annihilation - positron beam on target : very low emittance and no cooling needed, baseline for our proposal

$e^+$  on standard target (including crystals in channeling)  
→ Need Positrons of  $\approx 45$  GeV

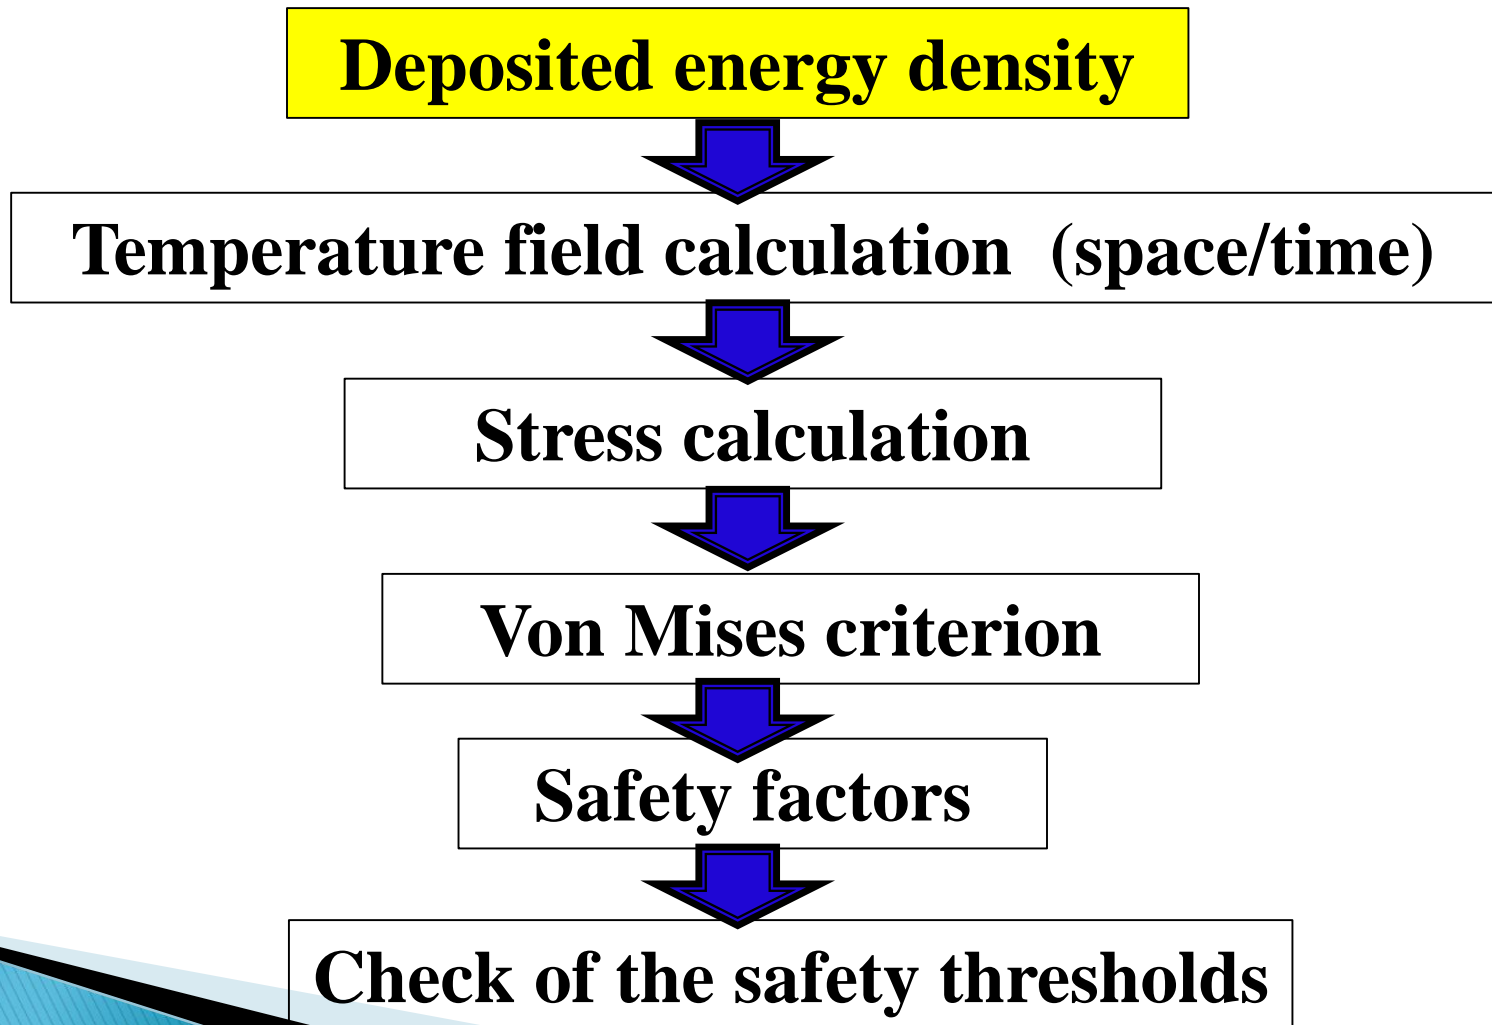

Ideally muons will *copy* the positron beam

Material	Density [g/cm <sup>3</sup> ]	Length [m]	Length [X <sub>0</sub> ]	eff [10 <sup>-6</sup> $\mu/e^+$ ]
Be	1.85	0.106	0.3	1.3
C	2.27	0.057	0.3	1.0

# Methodological approach

# Target size and discretization in the FLUKA code

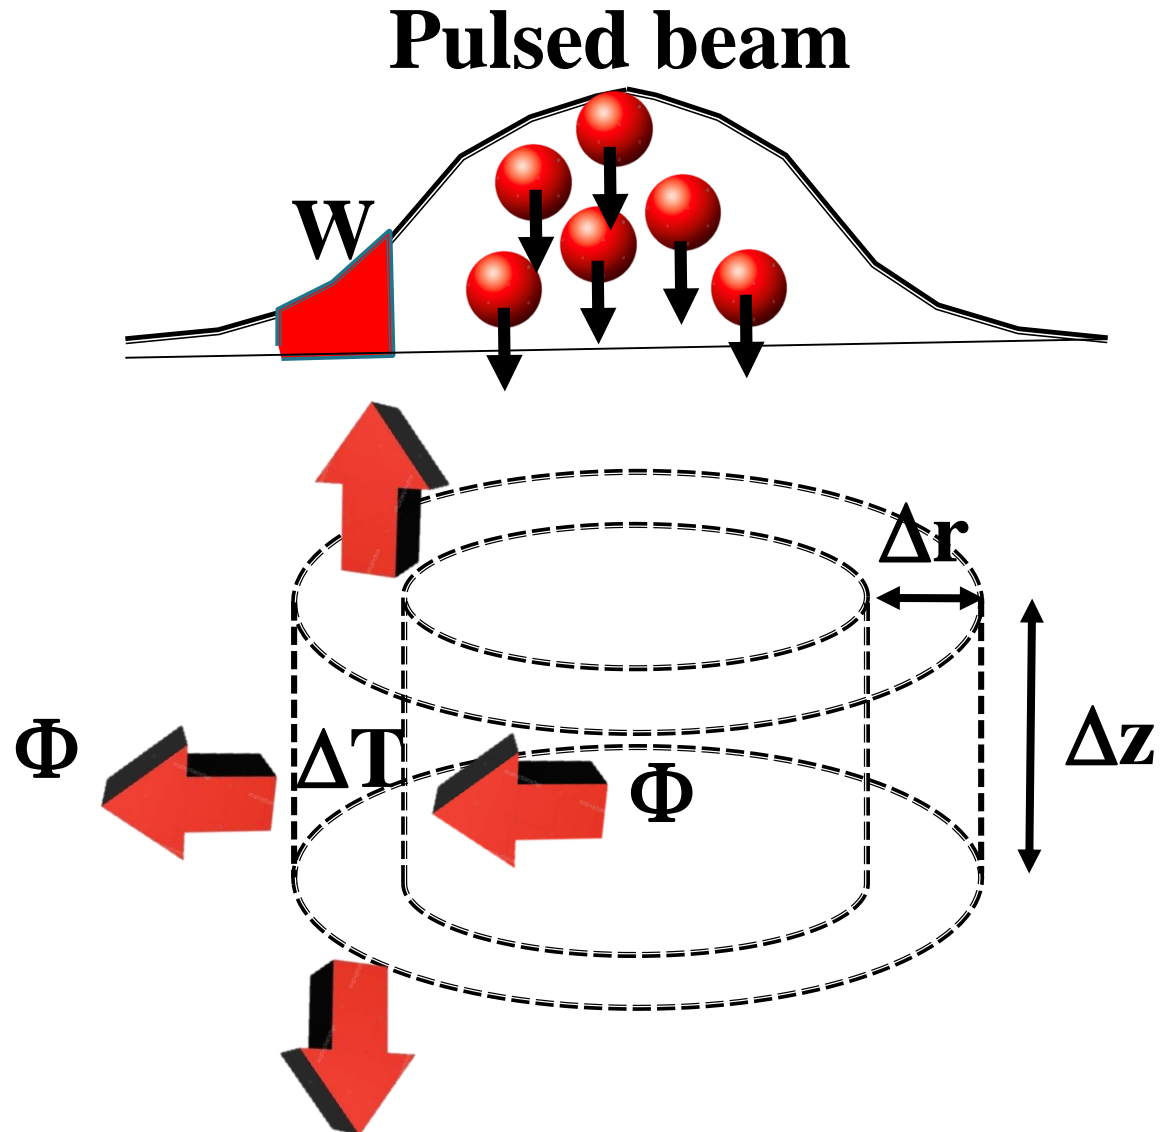

**Pulse duration**  $\tau$  : 10 ps

**Spot size a** : three case studies  
(10, 50, 140)  $\mu\text{m}$

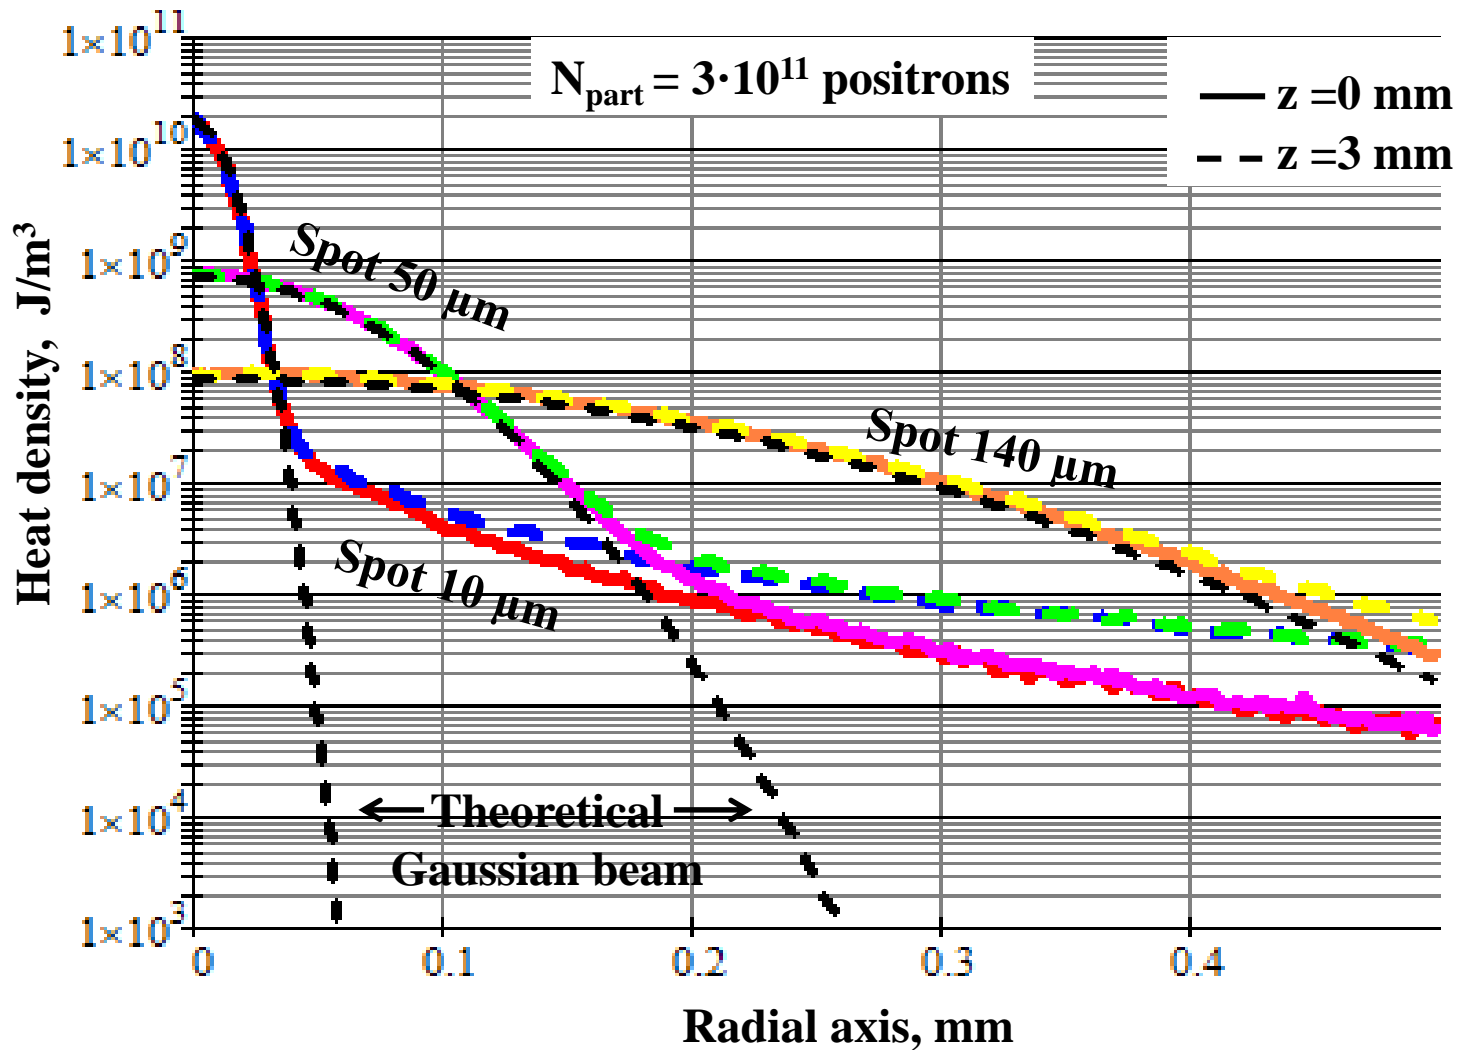

**Beryllium thickness**: 3 mm

**Beryllium radius** : 5 cm

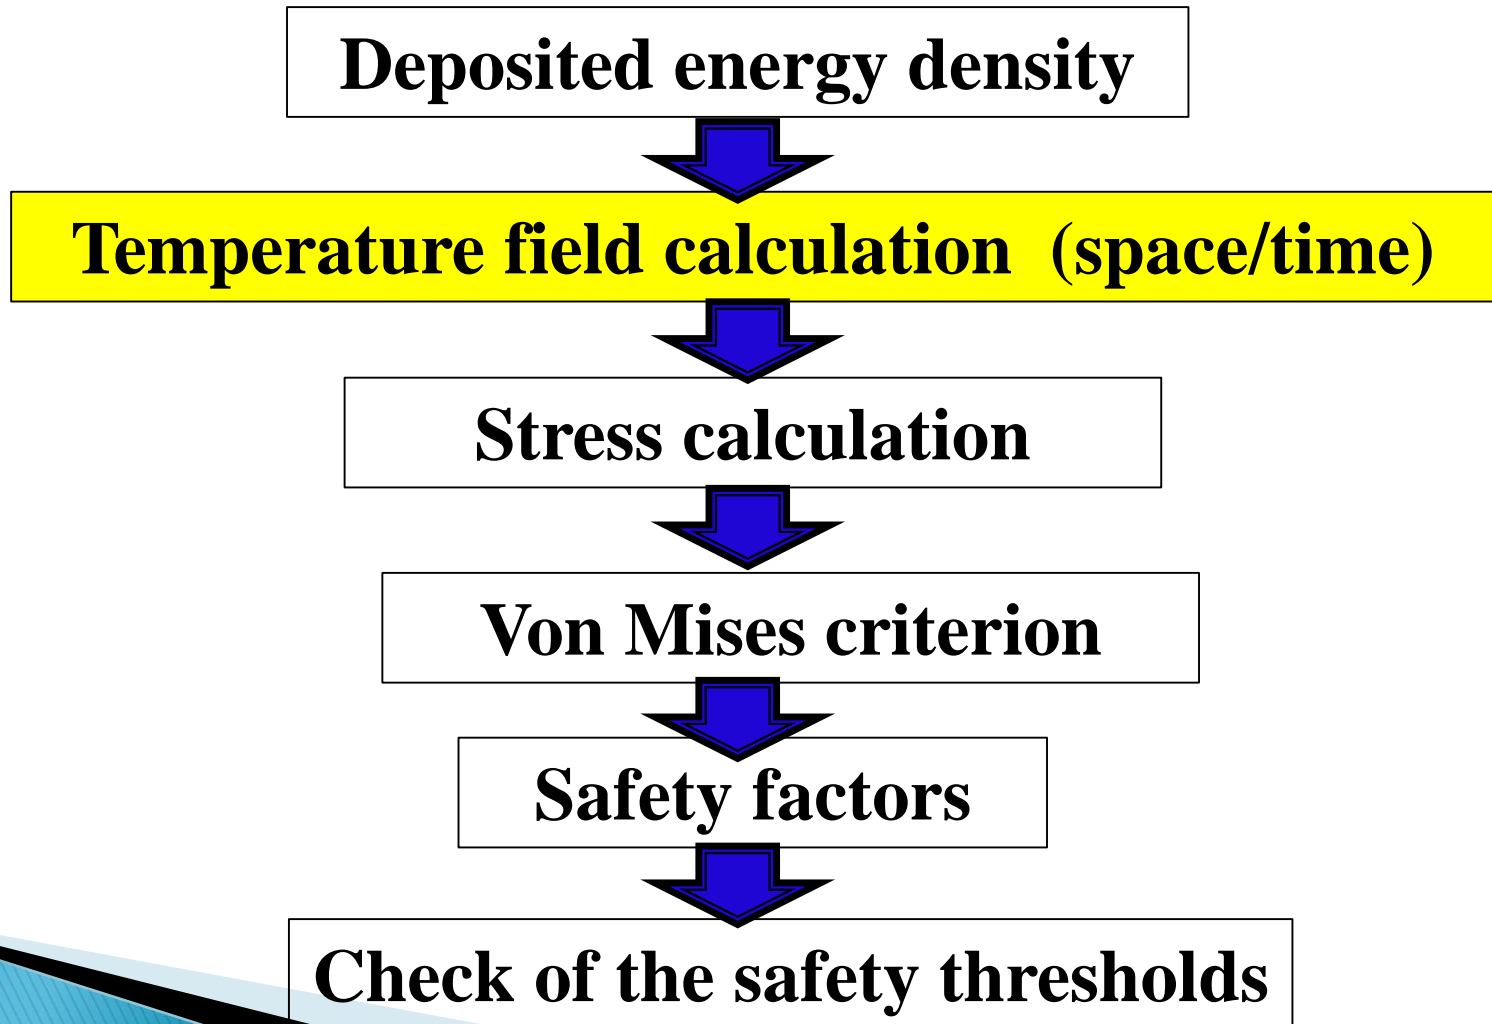

Radial symmetry in the distribution of deposited energy: use of cylindrical coordinates ( $r$ ,  $\varphi=1$ ) and discretization along  $z$ .

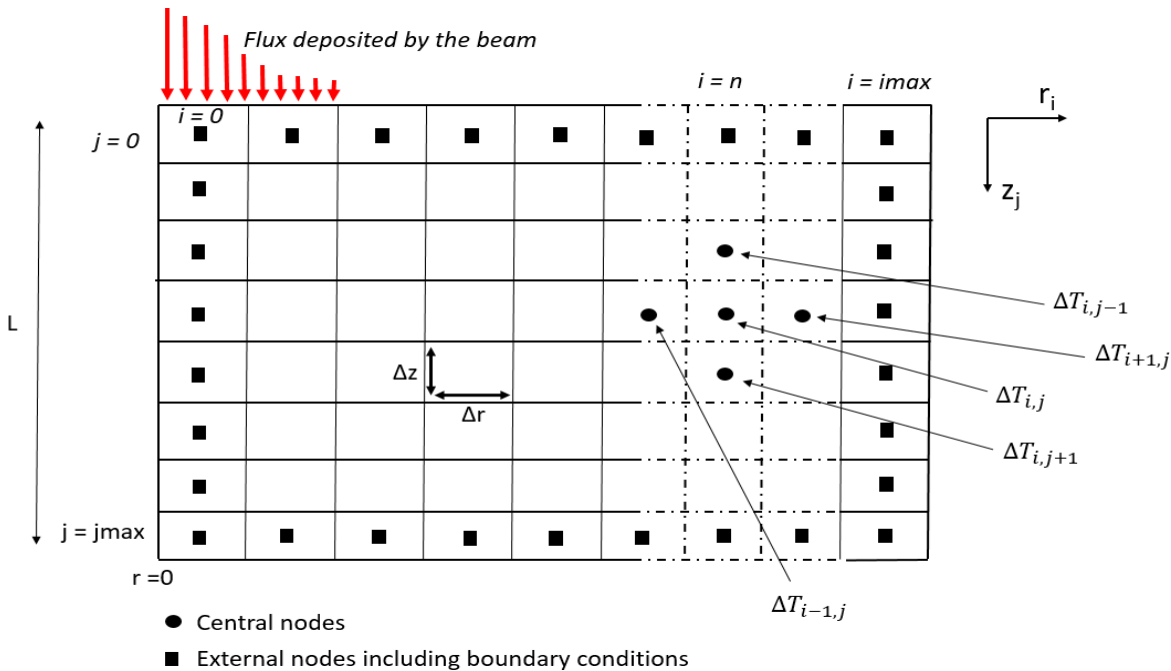

# Energy density deposited on the target

# Methodological approach

# Numerical model for temperature variation inside the material

## Basic model equation

$$\Delta T'_{i,j} = \Delta T_{i,j} + \left( \frac{W_{i,j} + \Phi_{net}}{V_{i,j}} \right) \frac{\Delta t}{\rho c_p}$$

Convergence condition  
(Fourier number  $F0 = Dt/L^2 \leq 1/2$ ):  $\Delta t < \frac{\min(\Delta r^2, \Delta z^2)}{4D_{max}}$

$i$  scan on  $r$ ,  $j$  scan on  $z$

$\Delta T_{i,j}'$  temperature at time  $t'$ ,  $\Delta T_{i,j}$  at time  $t$

$W_{i,j}$  power deposited in element  $i,j$

$\Phi_{net}$  heat flow exchanged by the element  $i,j$  in the time unit

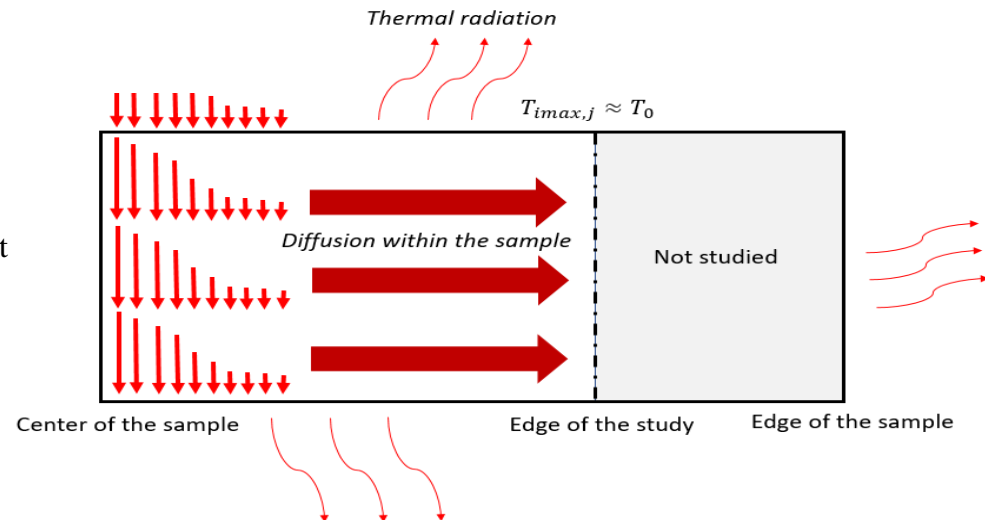

$\Delta t$  time lapse

$V$  element volume  $i,j$

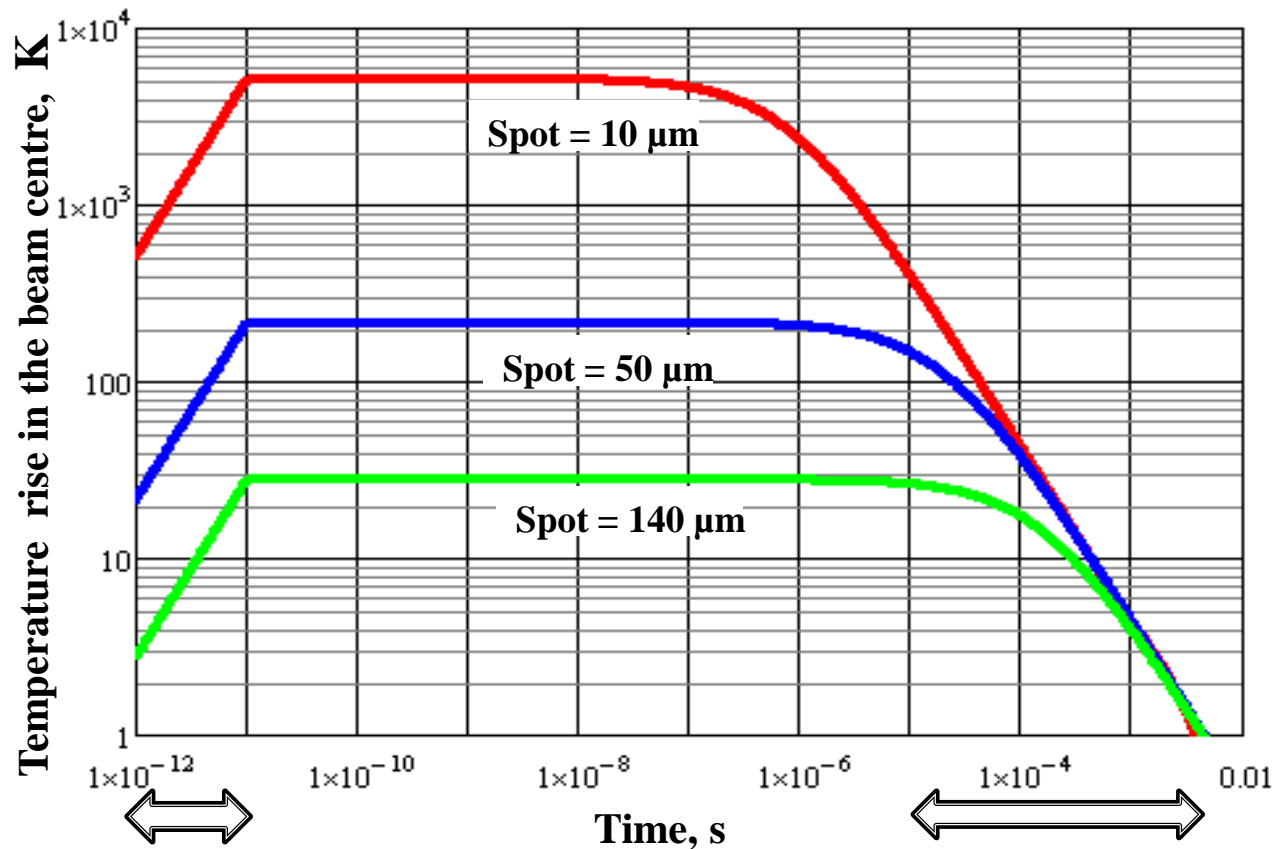

$\rho$  density

$C_p$  specific heat

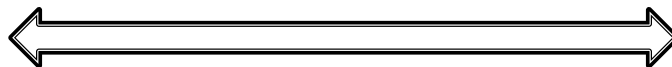

$D$  thermal diffusivity

# Temperature simulations with constant thermal parameters: linear model – surface temperature rise

During the bunch

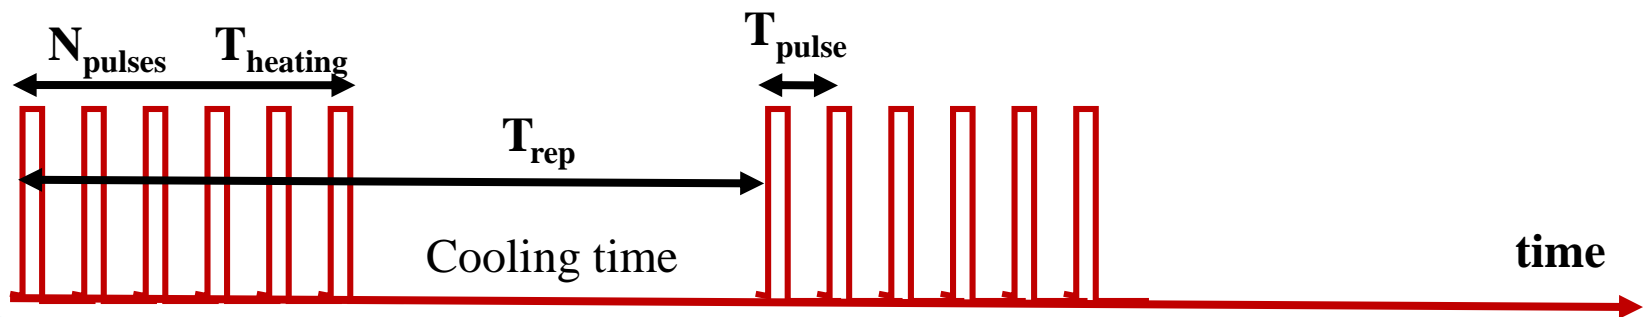

Non-diffusive period

Heat diffusion process

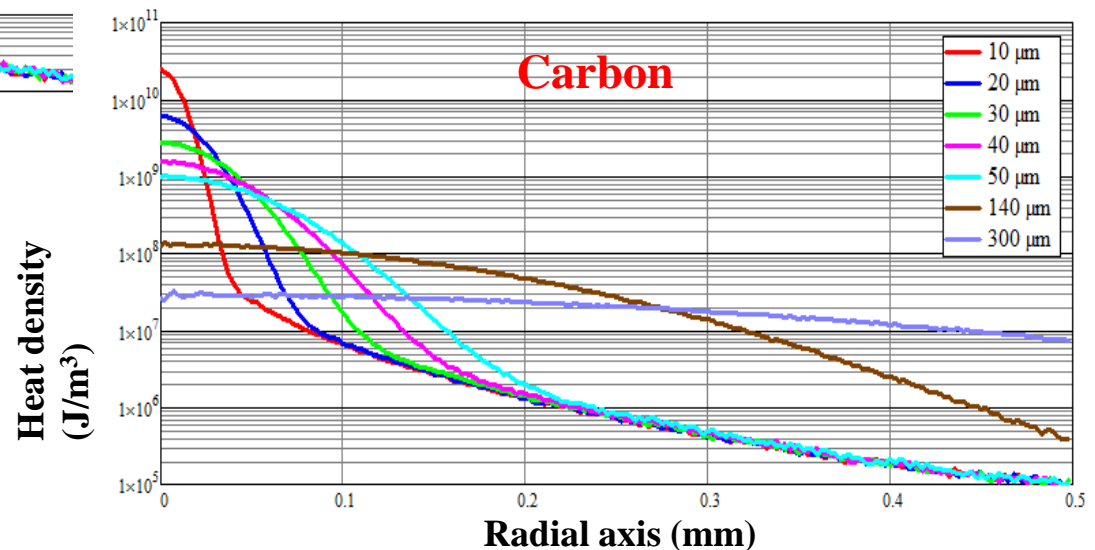

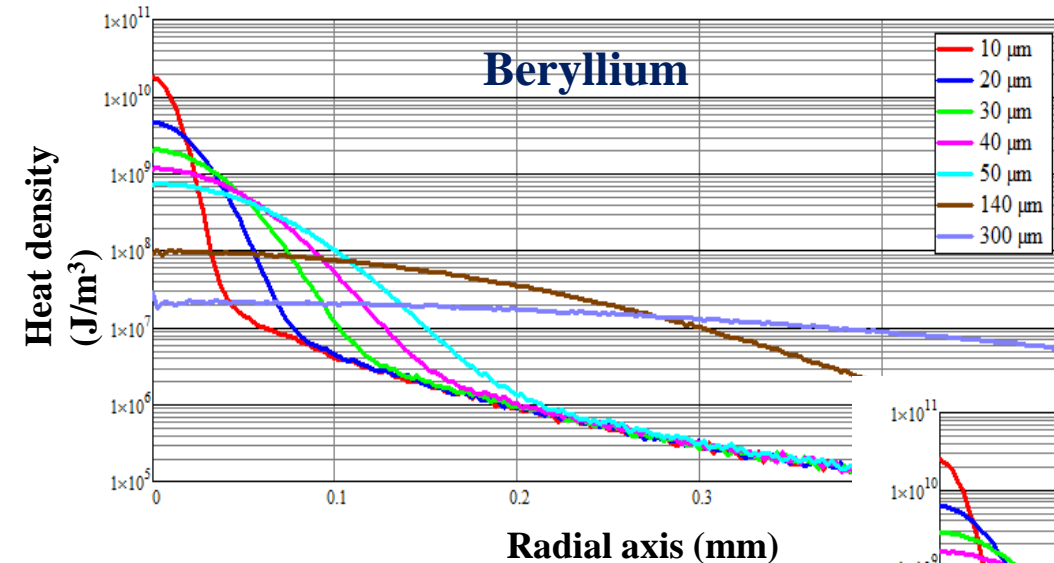

# Features of the benchmark positron beam

Symbol	Description	Reference Value
$a$	Gaussian beam spot size	300 $\mu\text{m}$
$\tau$	bunch duration	10 ps
$N_{part}$	positron number	$3 \cdot 10^{11}$
$N_{pulses}$	number of consecutive bunches	100
$T_{pulse}$	time between two bunches	400 ns
$T_{heating}$	total time of $N_{pulses}$	40 $\mu\text{s}$
$T_{rep}$	repetition time of the $N_{pulses}$ sequence	0.1 s

# Numerical simulation of the deposited energy onto the target

For this purpose Monte Carlo simulations have been performed with FLUKA both for Beryllium and Carbon (Low-Z materials). The figures show the heat deposited by a single bunch of  $3 \cdot 10^{11}$   $e^+$  as a function of the radial distance from the center.

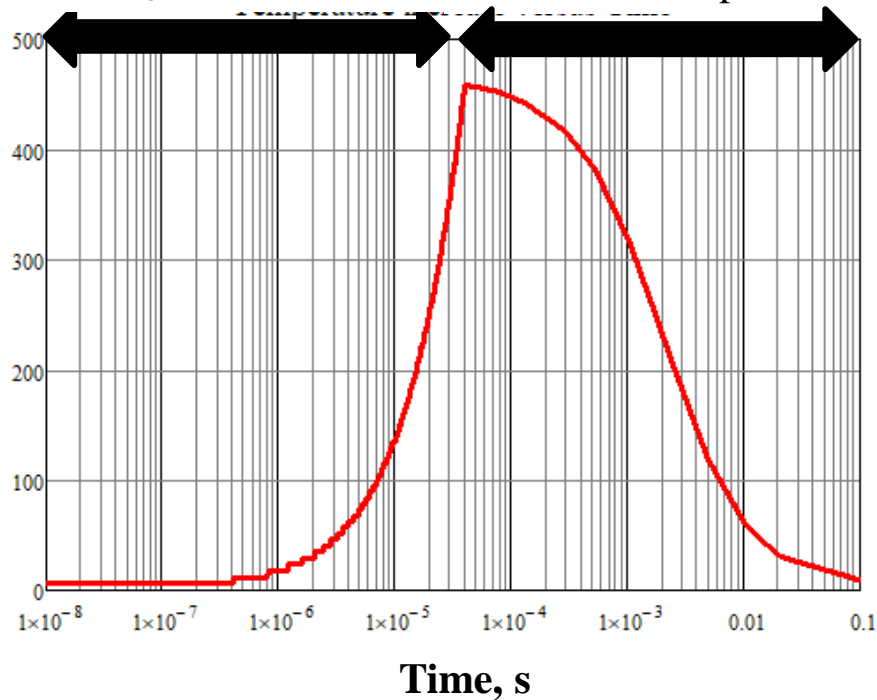

# Temperature temporal evolution in the beam spot center after a sequence of bunches

After 100 bunches = 40  $\mu\text{s}$

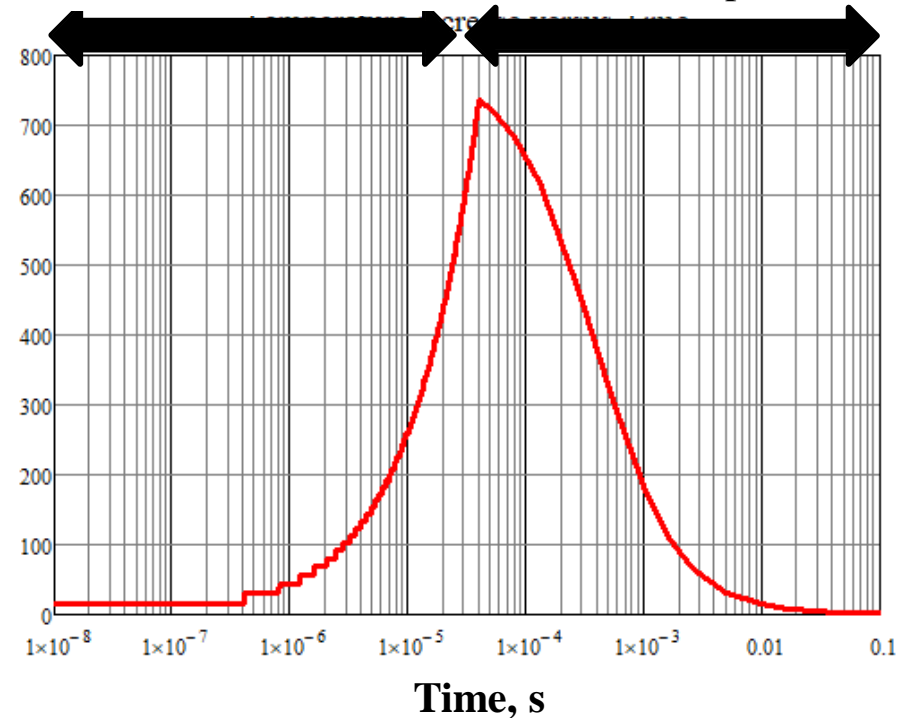

**Beryllium**

During the 100 bunches    Heat diffusion process

**Carbon**

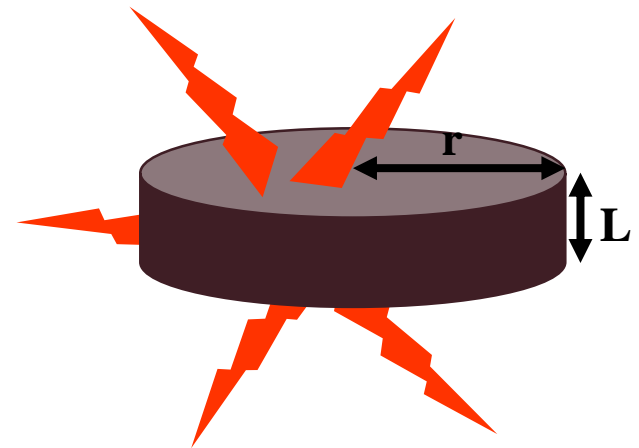

During the 100 bunches    Heat diffusion process

# Asymptotic temperature increase: Steady State Temperature

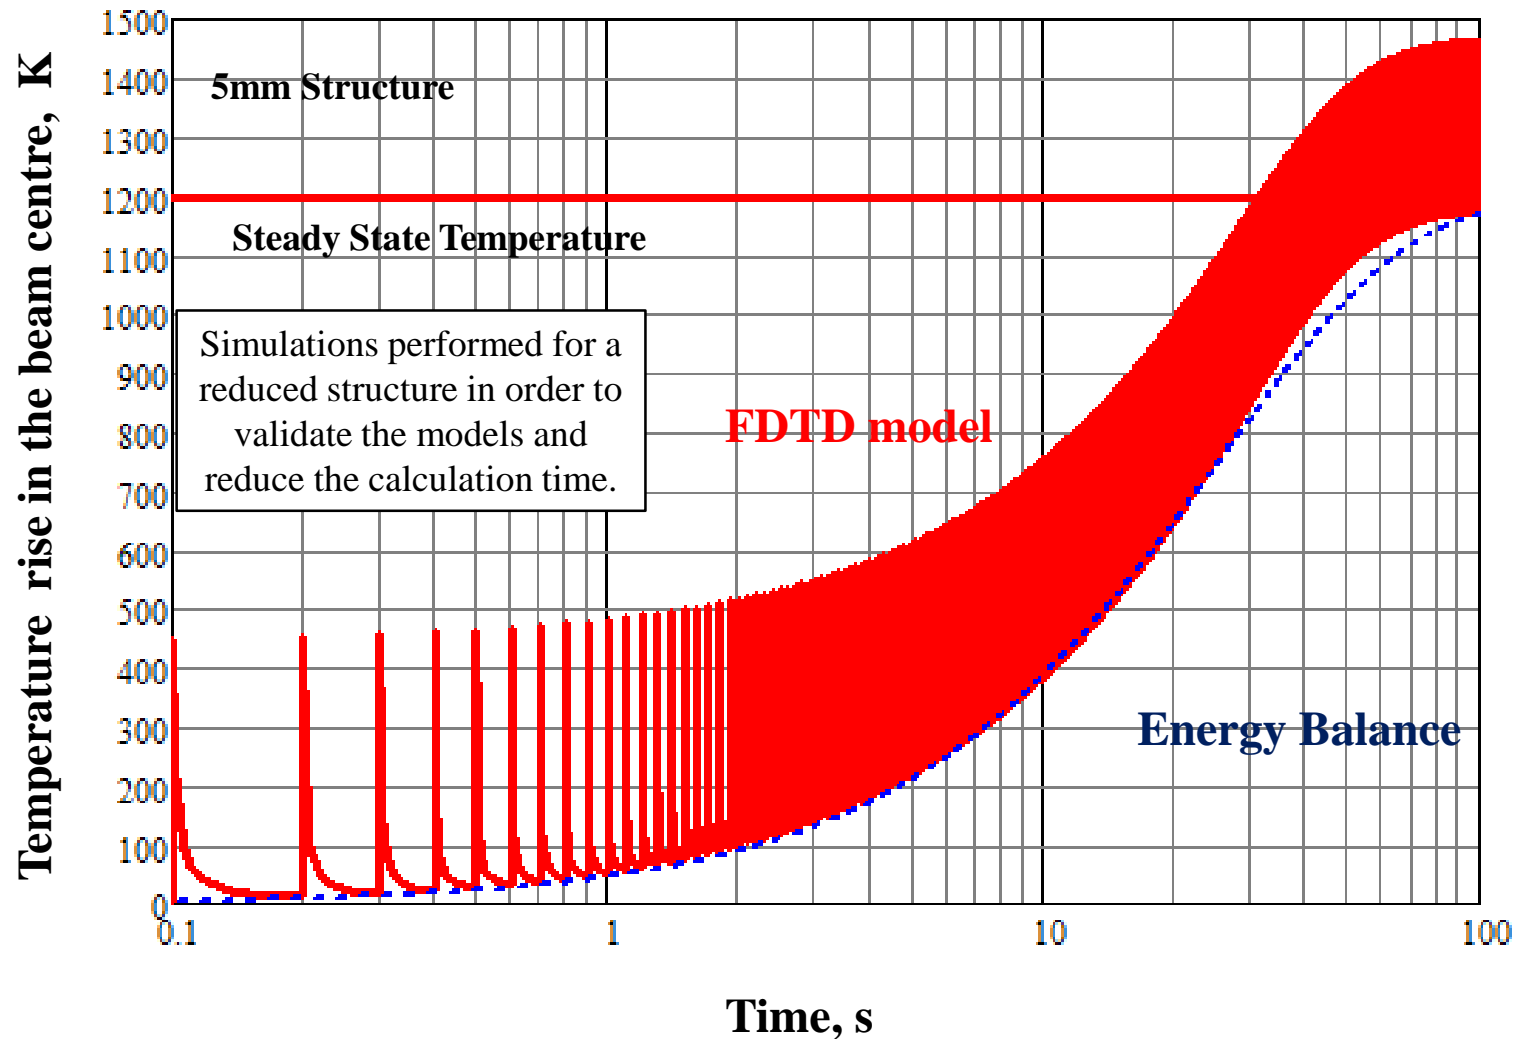

Obtained from the energy balance between the deposited energy and the dissipation by *thermal radiation*

$$\Delta T = \sqrt[4]{T_{amb}^4 + \left( \frac{a^2 \cdot L}{r^2 + r \cdot L} \right) \frac{C_{max,a} \cdot N_{part} \cdot N_{pulses}}{\varepsilon \cdot \sigma_B \cdot T_{rep}}} - T_{amb}$$

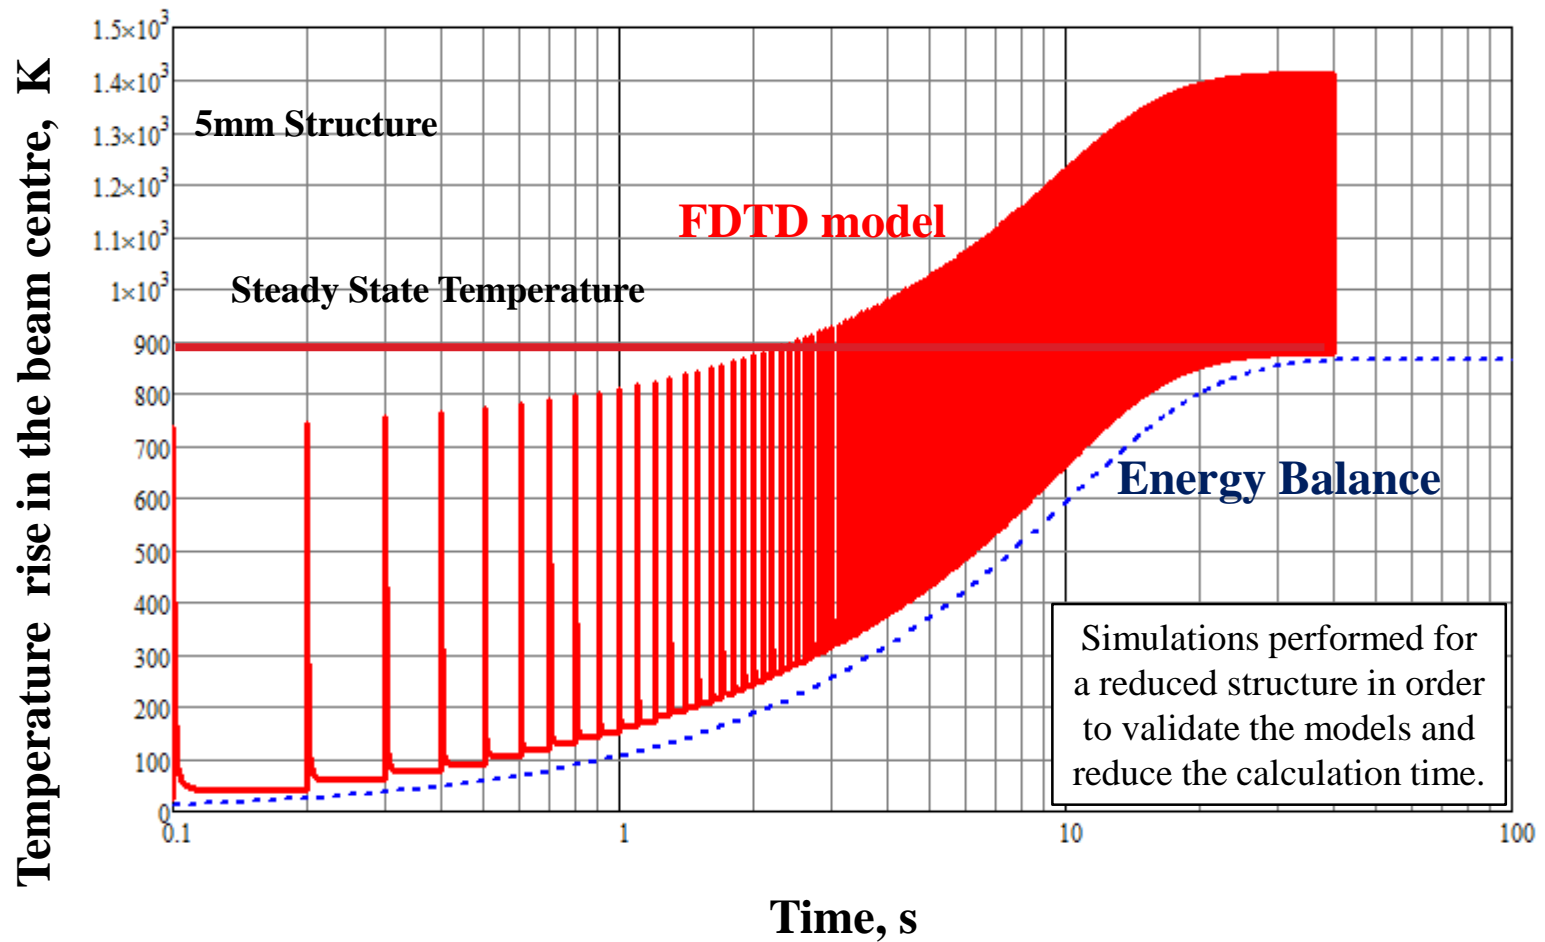

$\varepsilon$  emissivity,  $\sigma_B$  Stefan-Boltzmann constant,  $T_{rep}$  pulse train repetition period,  $C_{max,a}$  deposited energy density peak by the Fluka data

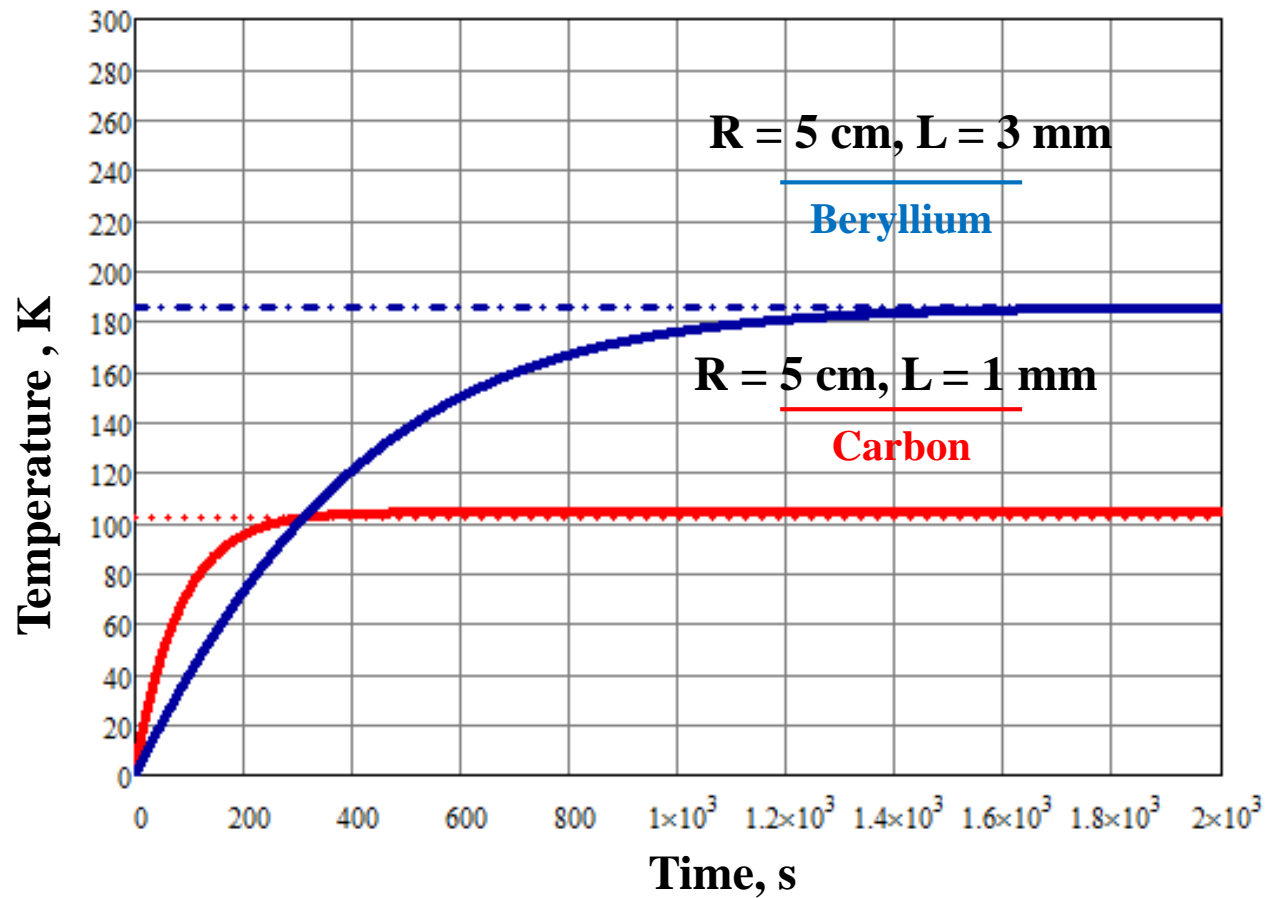

# Comparison between the numerical model and the model based on the energy balance for the Beryllium target

# Comparison between the numerical model and the model based on the energy balance for the Carbon target

# Energy Balance Model and Steady State Temperature

# Steady State Temperature

## **Beryllium target**

radius  $r = 5$  cm, thickness  $L = 3$  mm;

Beam spot size:  $a = 300$   $\mu\text{m}$ ;

Number of positrons:  $N = 3 \cdot 10^{11}$

Cooling time:  $T_{\text{Rep}} = 0.1$  s.

Steady state temperature increase:  $\Delta T_{\text{ss}} = 185.5$  K

Melting point: 1551 K

## **Carbon target**

radius  $r = 5$  cm, thickness  $L = 1$  mm;

Beam spot size:  $a = 300$   $\mu\text{m}$ ;

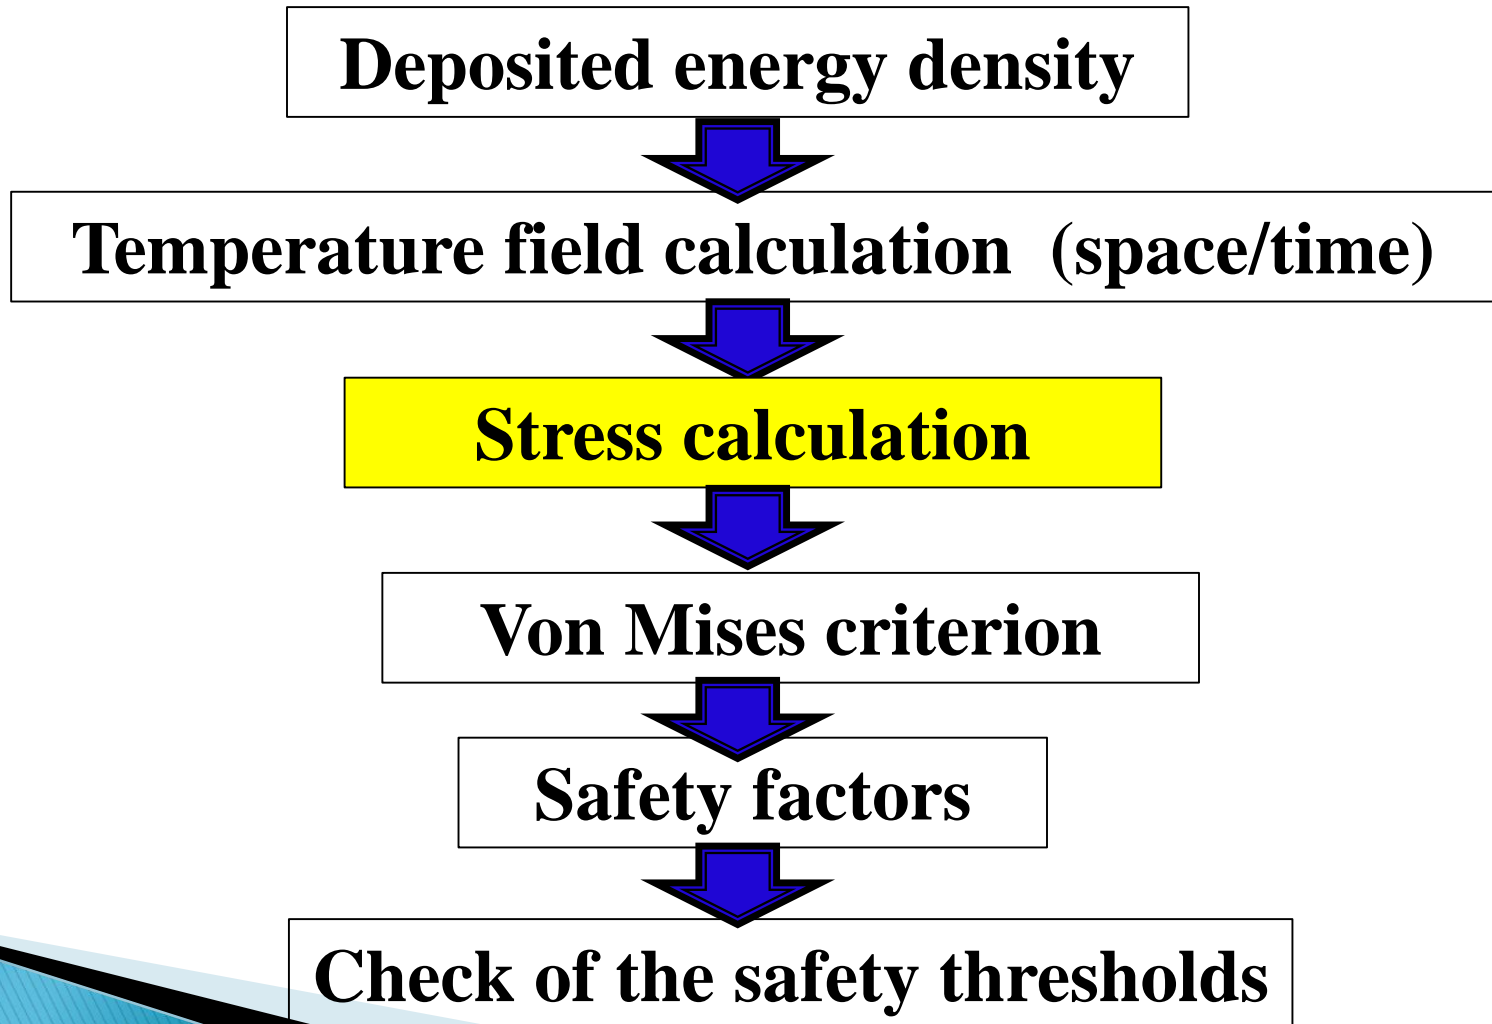

Number of positrons:  $N = 3 \cdot 10^{11}$

Cooling time:  $T_{\text{Rep}} = 0.1$  s.

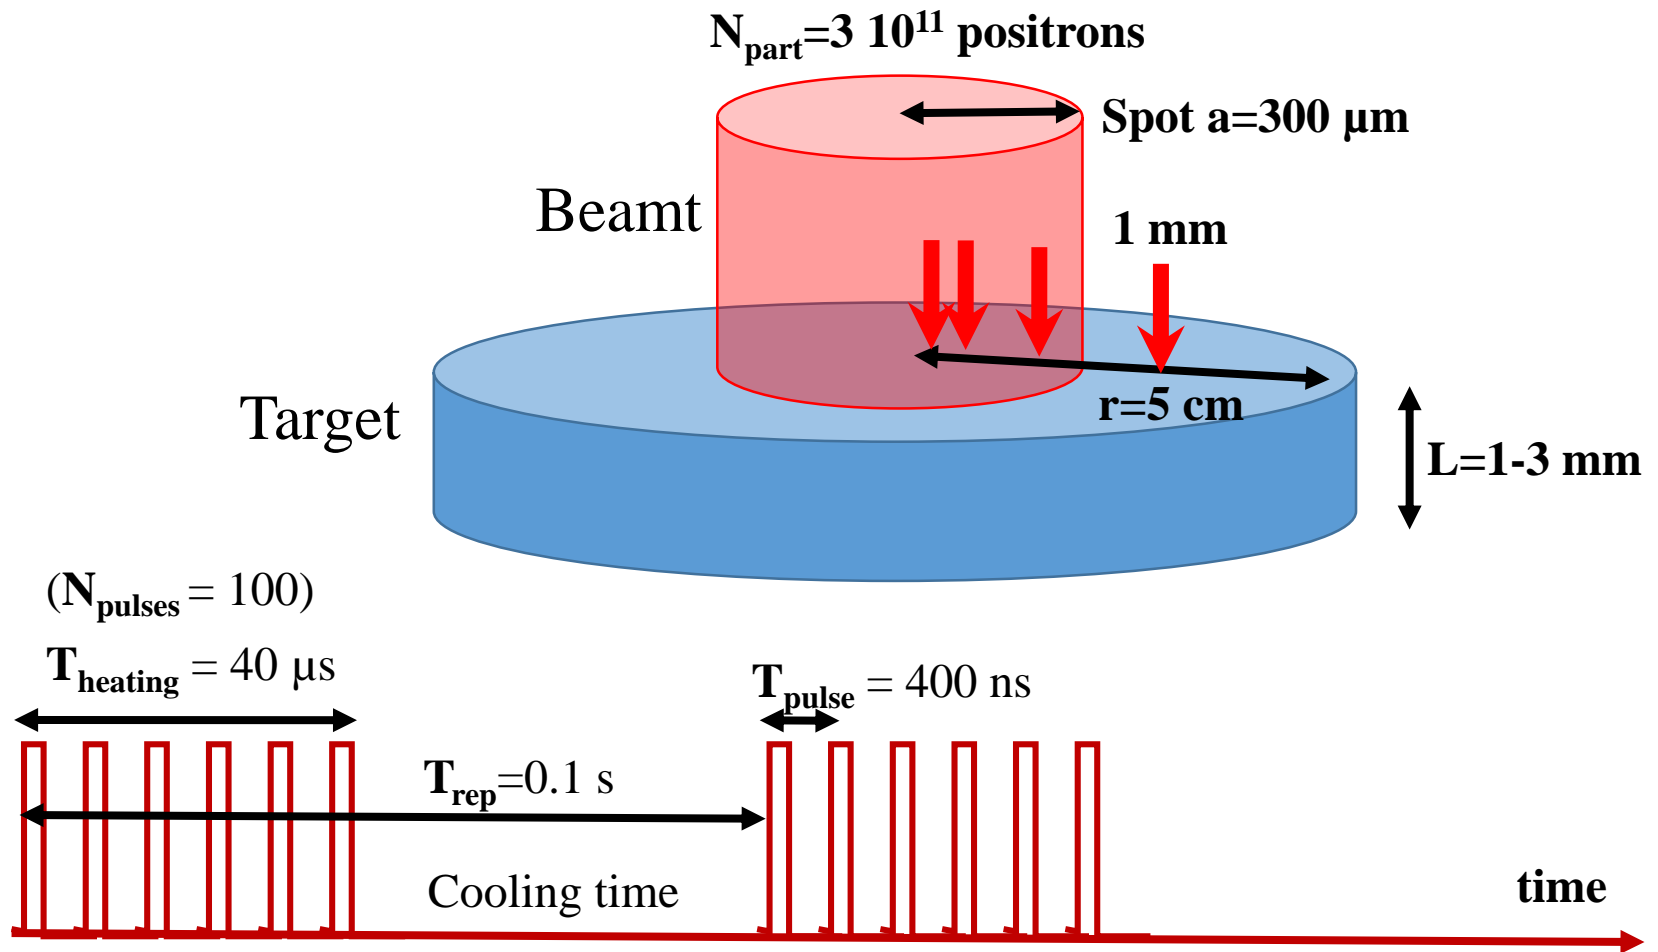

Steady state temperature increase:  $\Delta T_{\text{ss}} = 102.5$  K

Melting point: 3923 K

# Methodological approach

# Stress and Safety factors

# Stress Relations

## Radial Stress

$$\sigma_{rr} = \frac{E(r)}{1-\nu} \left[ \frac{1}{R^2} \int_0^R \alpha T(r,t) r dr - \frac{1}{r^2} \int_0^r \alpha T(r,t) r dr \right]$$

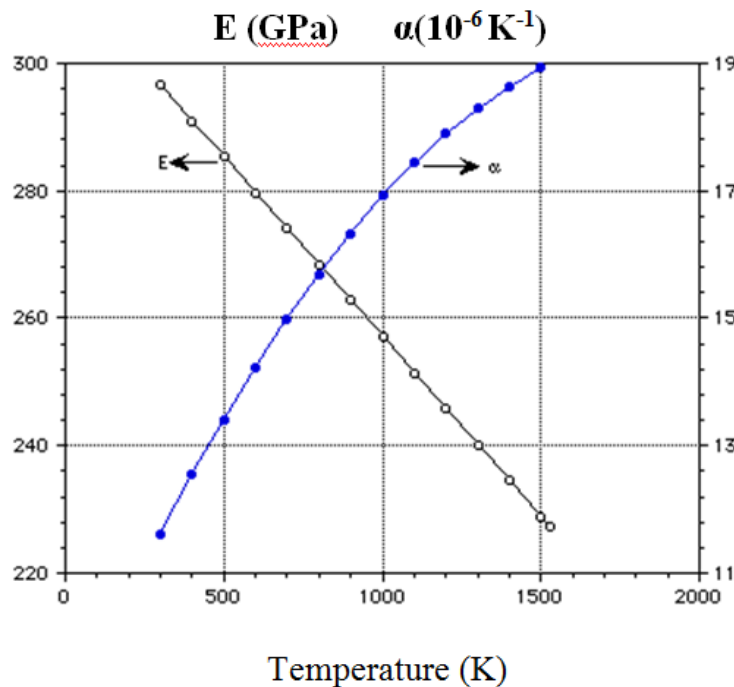

## Hoop Stress

$$\sigma_{\theta\theta} = \frac{E(r)}{1-\nu} \left[ \frac{1}{R^2} \int_0^R \alpha T(r,t) r dr + \frac{1}{r^2} \int_0^r \alpha T(r,t) r dr - \alpha T(r,t) \right]$$

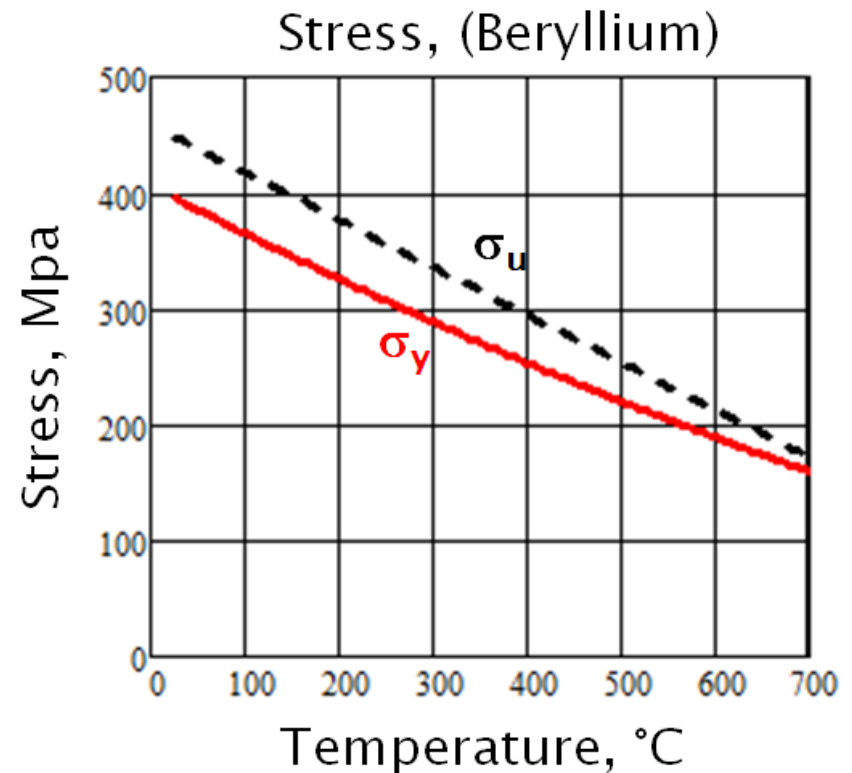

## Axial Stress

$$\sigma_{zz} = \frac{E(r)}{1-\nu} \left[ \frac{2}{R^2} \int_0^R \alpha T(r,t) r dr - \alpha T(r,t) \right]$$

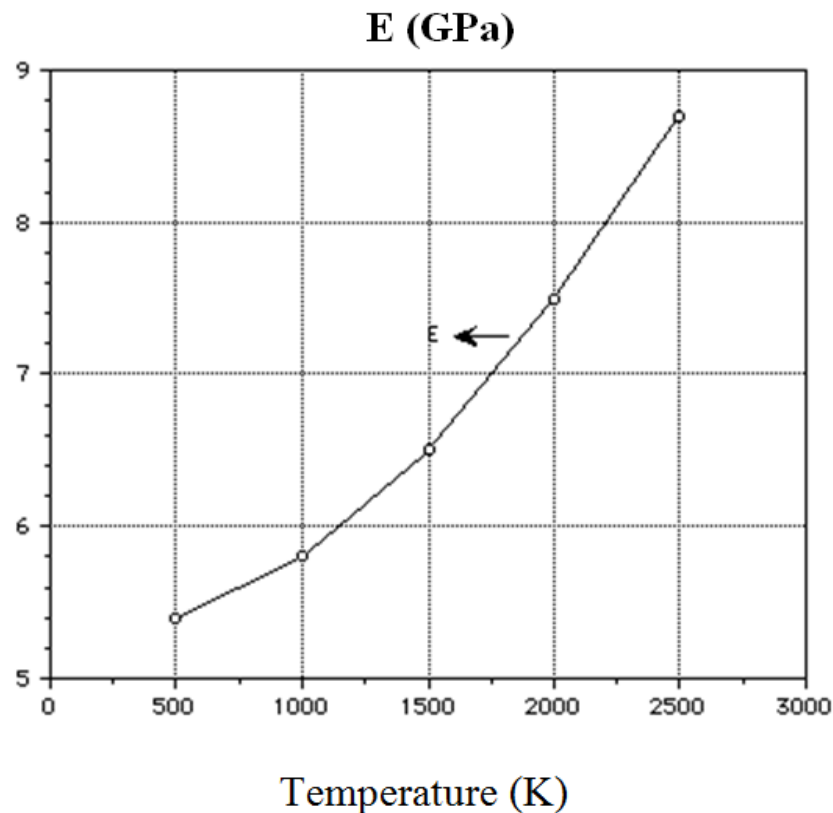

## Elastic properties: Beryllium

Elastic modulus and coefficient of thermal expansion for beryllium

## Elastic properties: **Carbon**

Elastic modulus of pyrolytic graphite

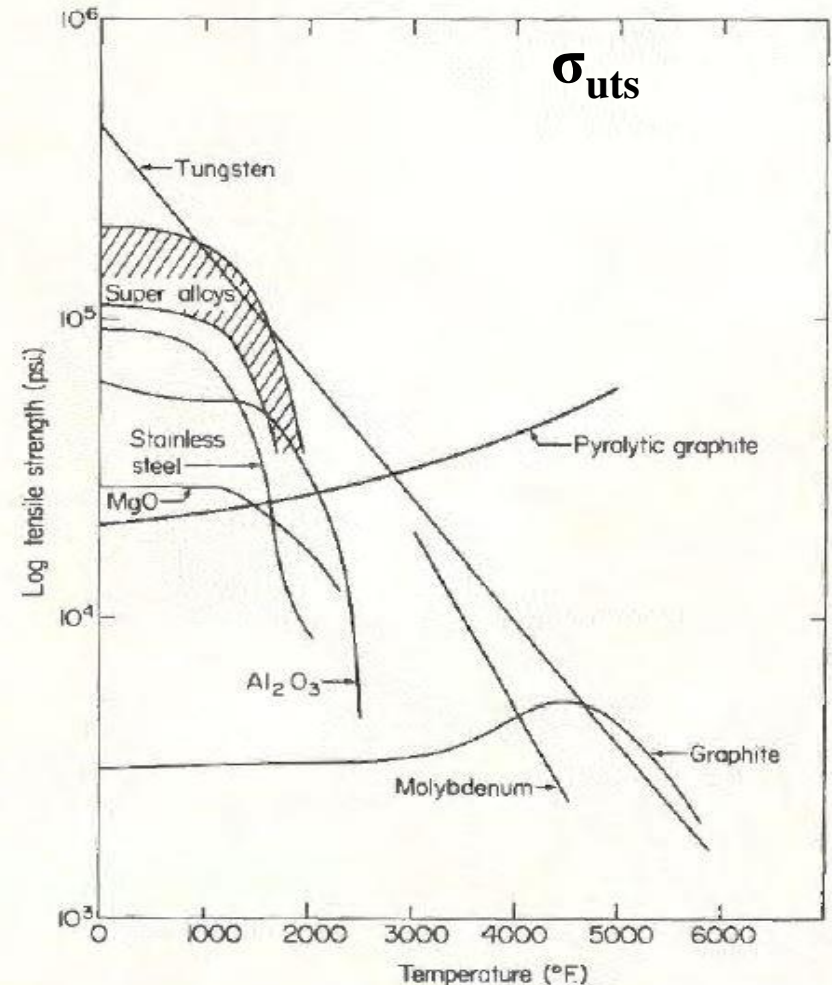

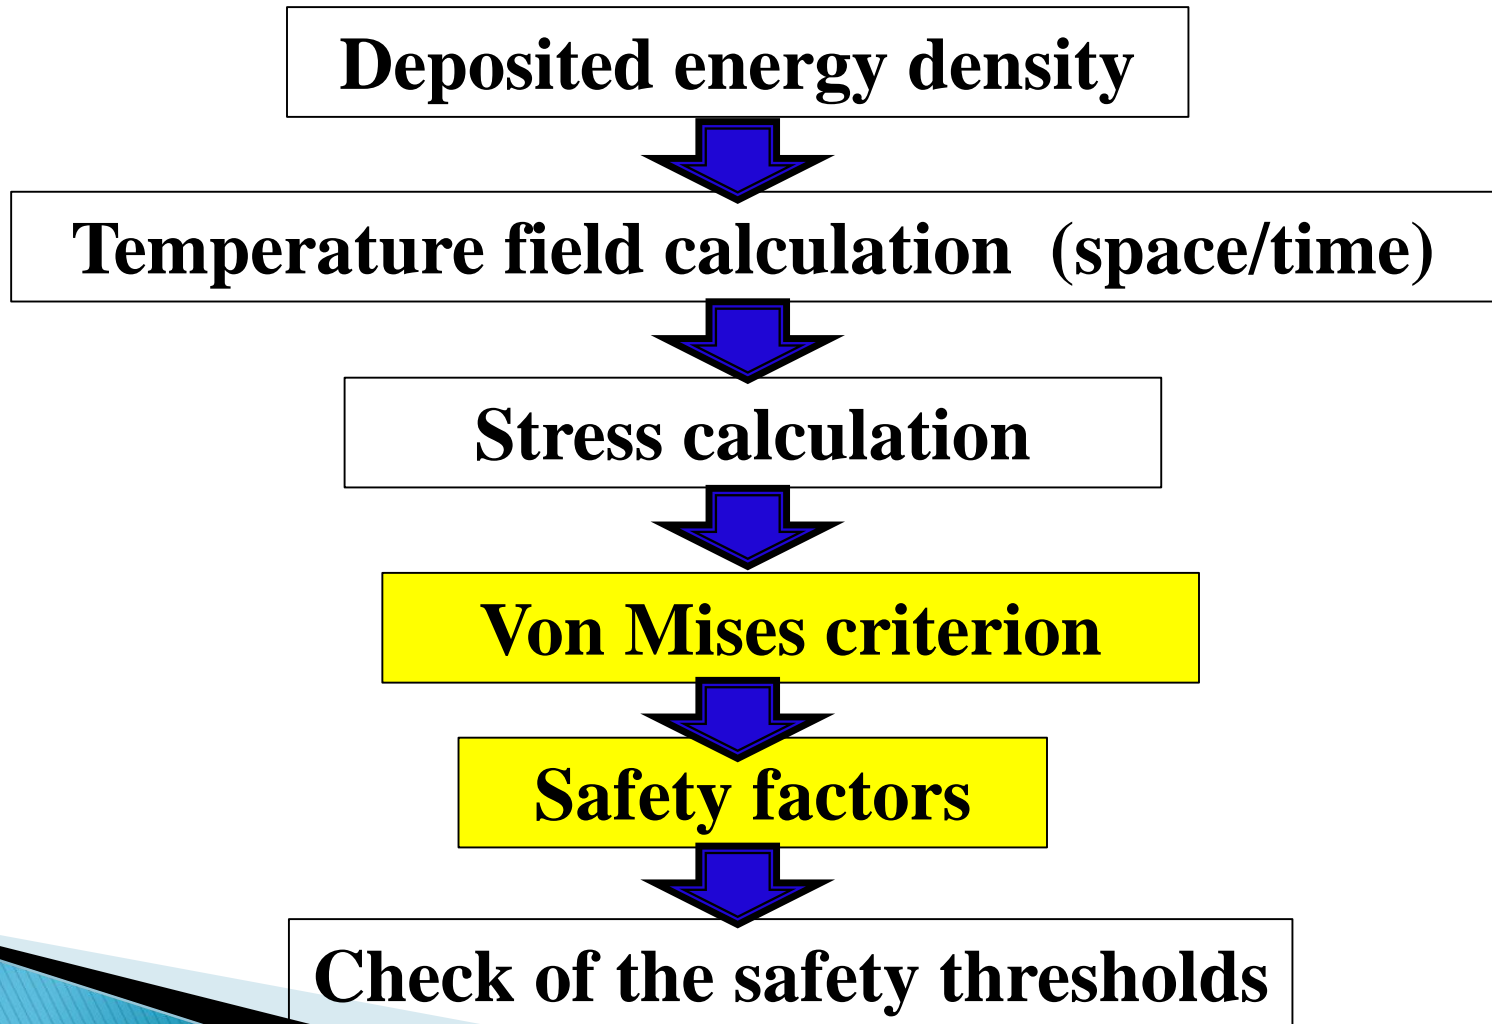

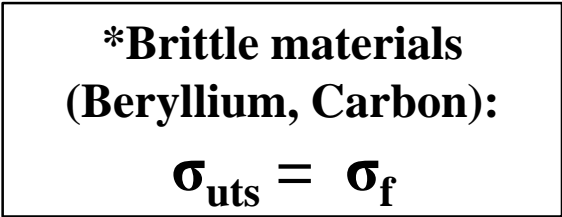

Fig. 8. Ultimate tensile strength of pyrolytic graphite parallel to basal planes in comparison with other high-temperature materials.

# Methodological approach

# Typical Stress-Strain Diagram

# Von Mises Equivalent Stress and Safety Factor

### Von Mises Equivalent Stress

$$\sigma_e = \sqrt{\frac{(\sigma_{rr} - \sigma_{\theta\theta})^2 + (\sigma_{rr} - \sigma_{zz})^2 + (\sigma_{\theta\theta} - \sigma_{zz})^2}{2}}$$

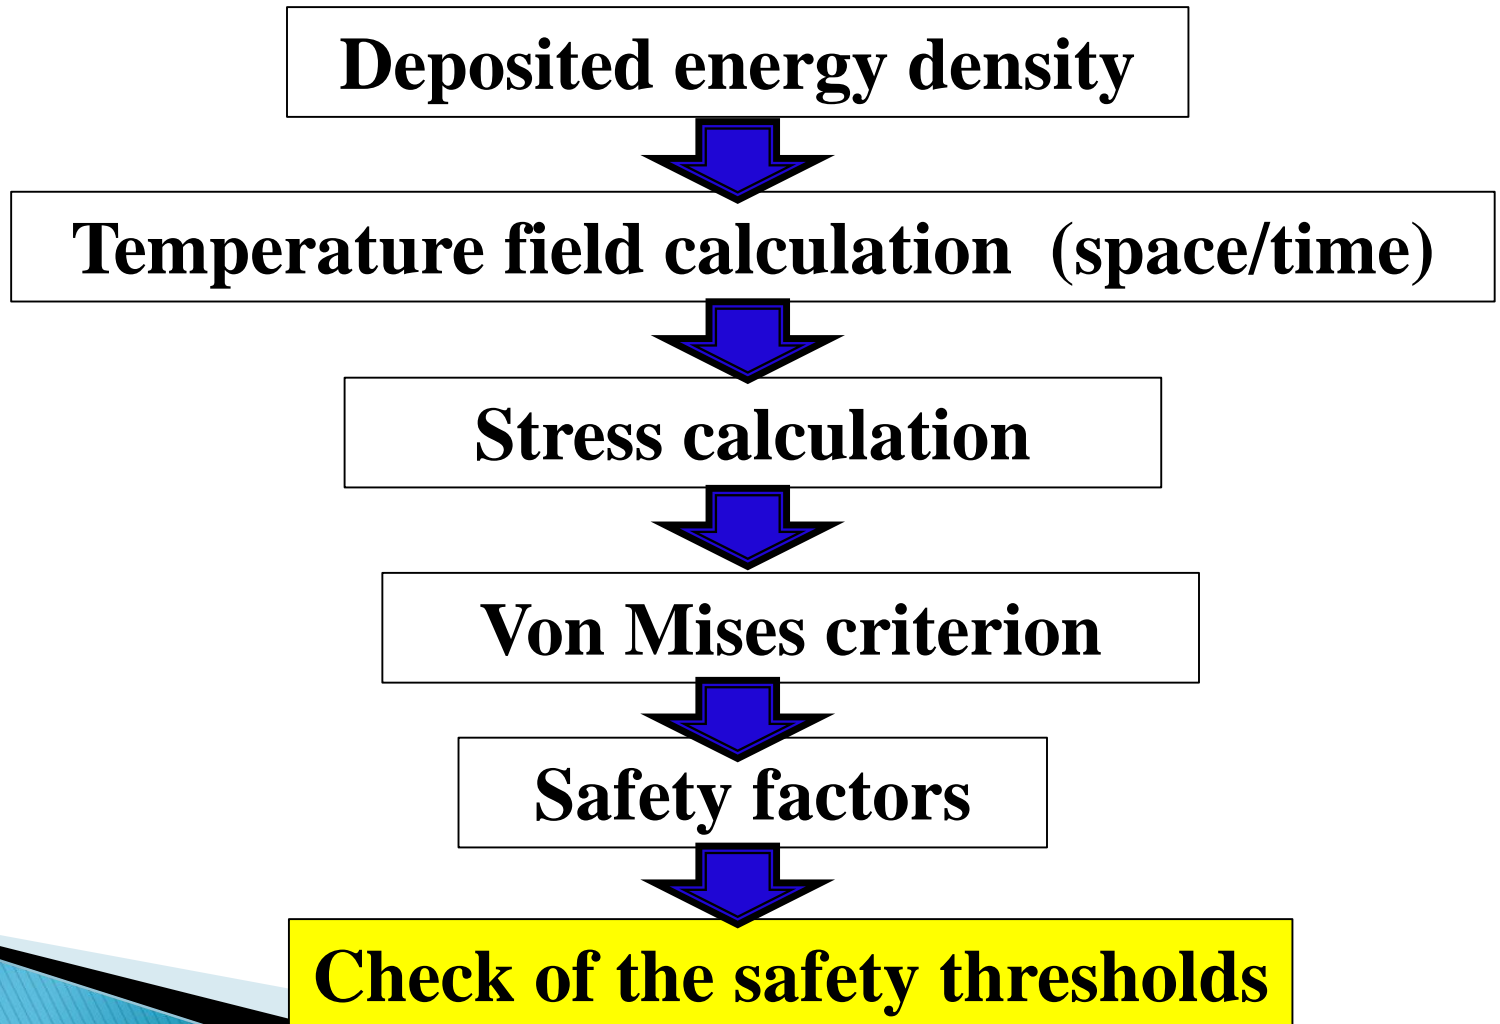

$$\frac{\sigma_y}{\sigma_e} > 1$$

**Safety factor and threshold  
for Beryllium target**

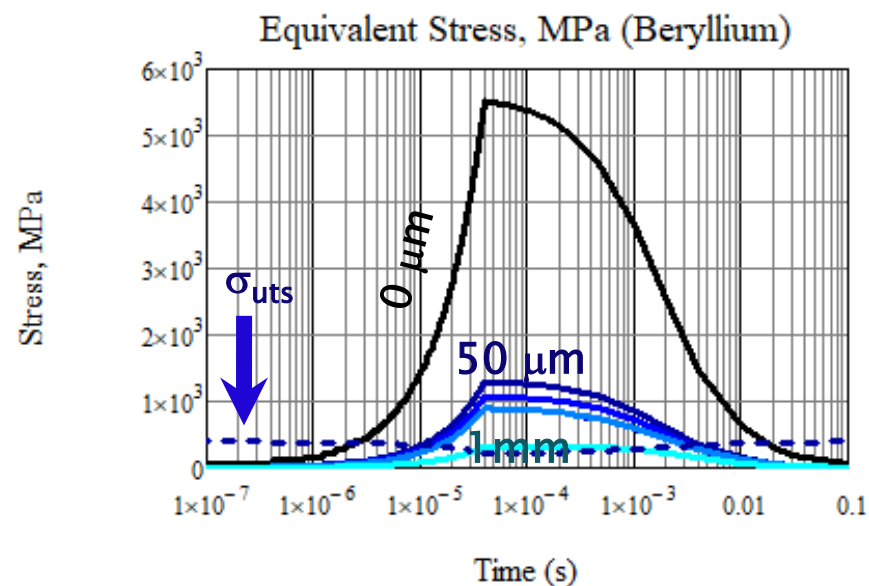

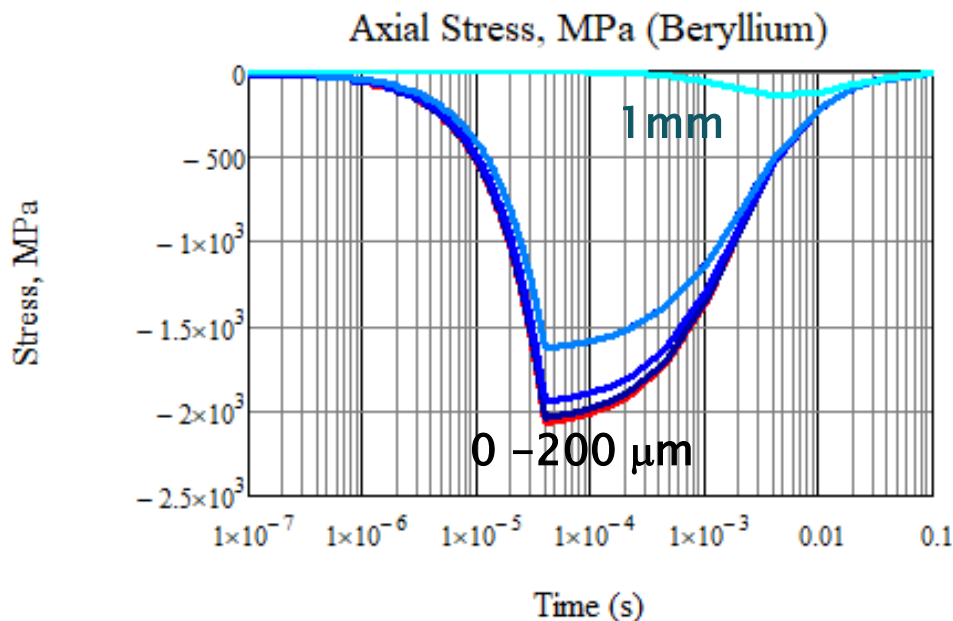

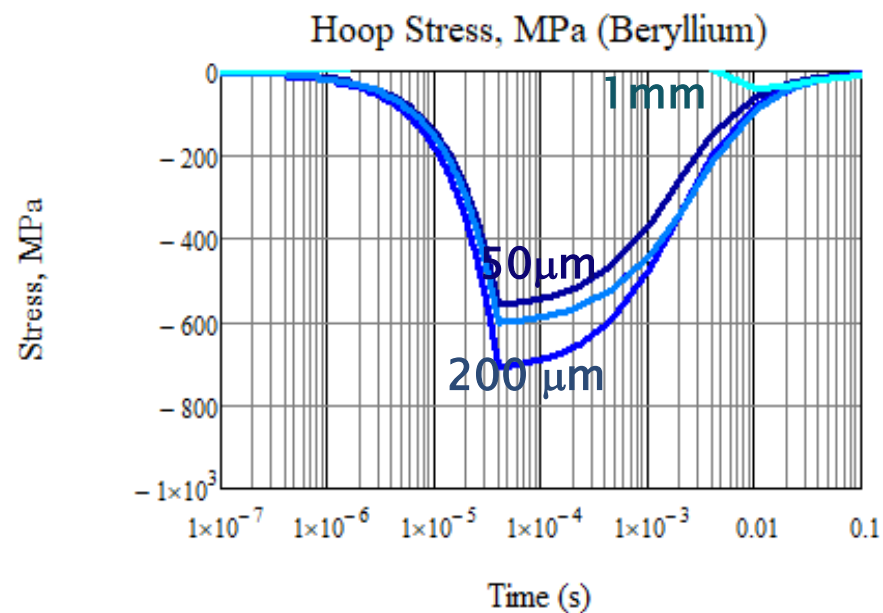

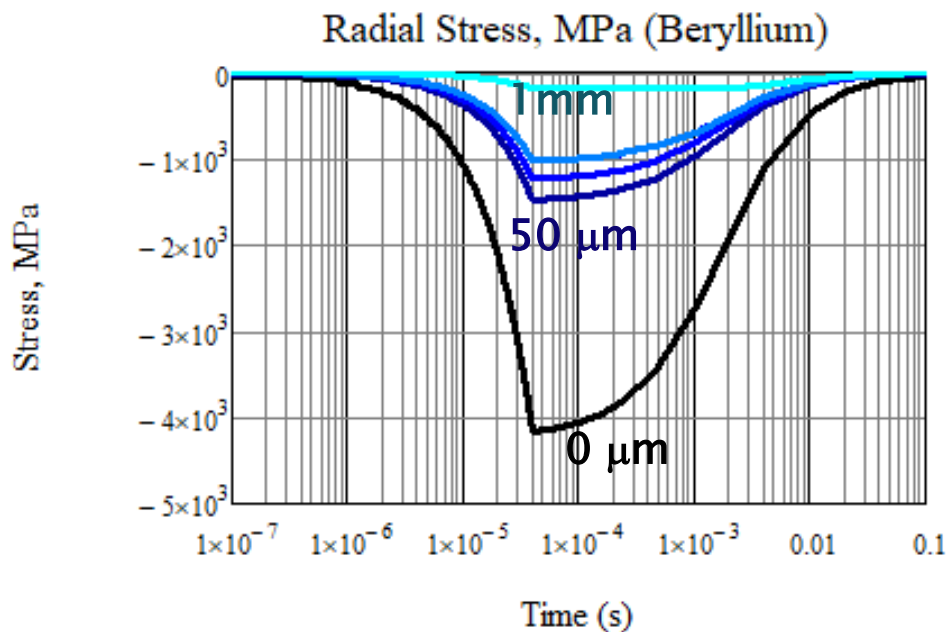

$$\frac{\sigma_{uts}}{\sigma_e} > 2$$

**Safety factor and threshold  
for Carbon target**

# Methodological approach

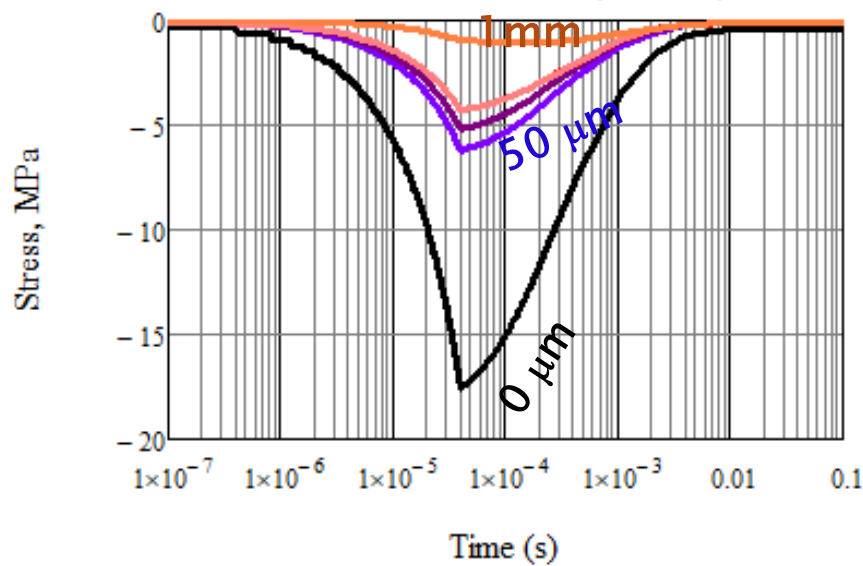

# Stress and Safety factors – Beryllium – Spot 300 $\mu\text{m}$

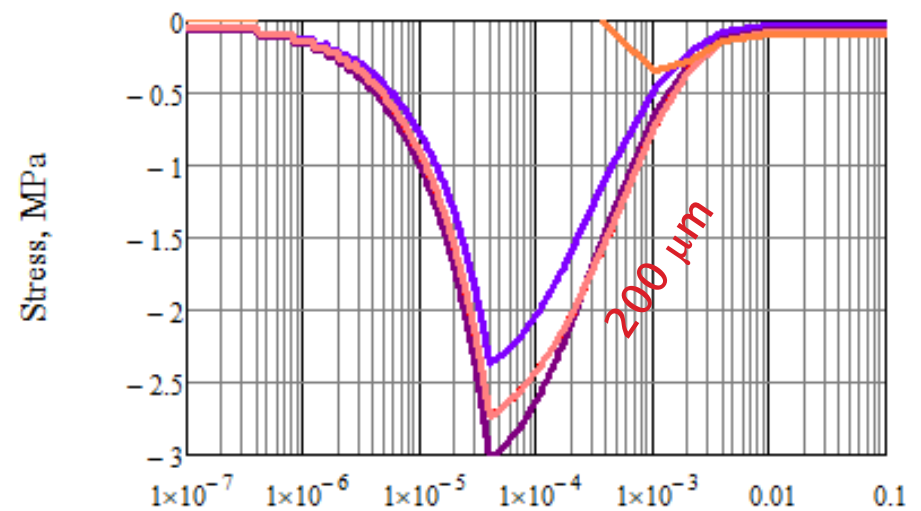

# Stress and Safety factors – Carbon – Spot 300 $\mu\text{m}$

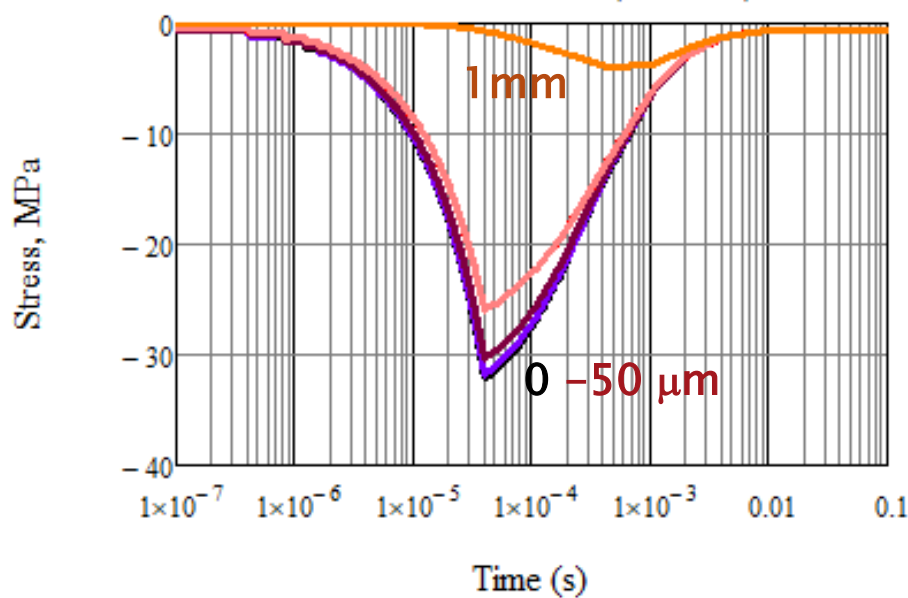

Radial Stress, MPa (Carbon)

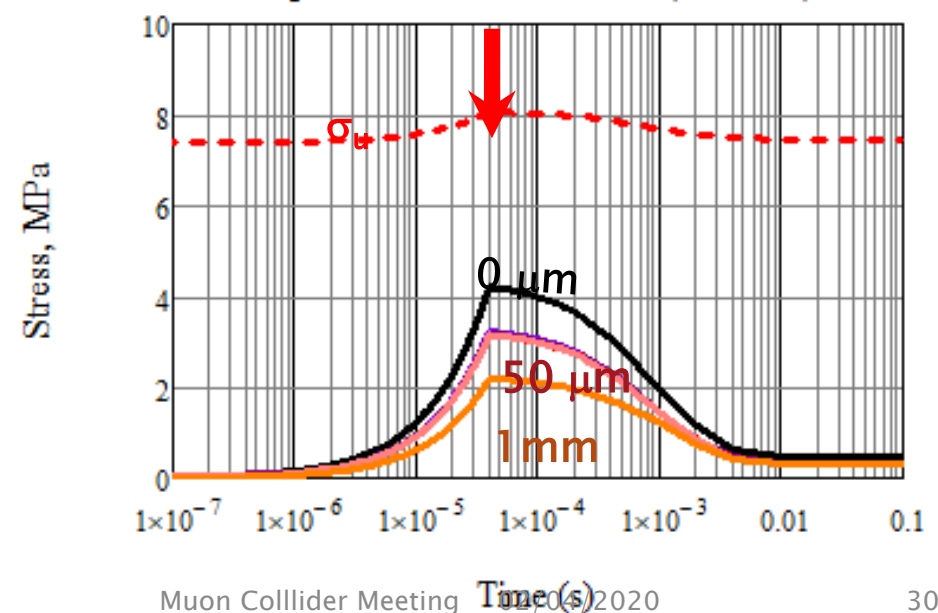

Hoop Stress, MPa (Carbon)

Axial Stress, MPa (Carbon)

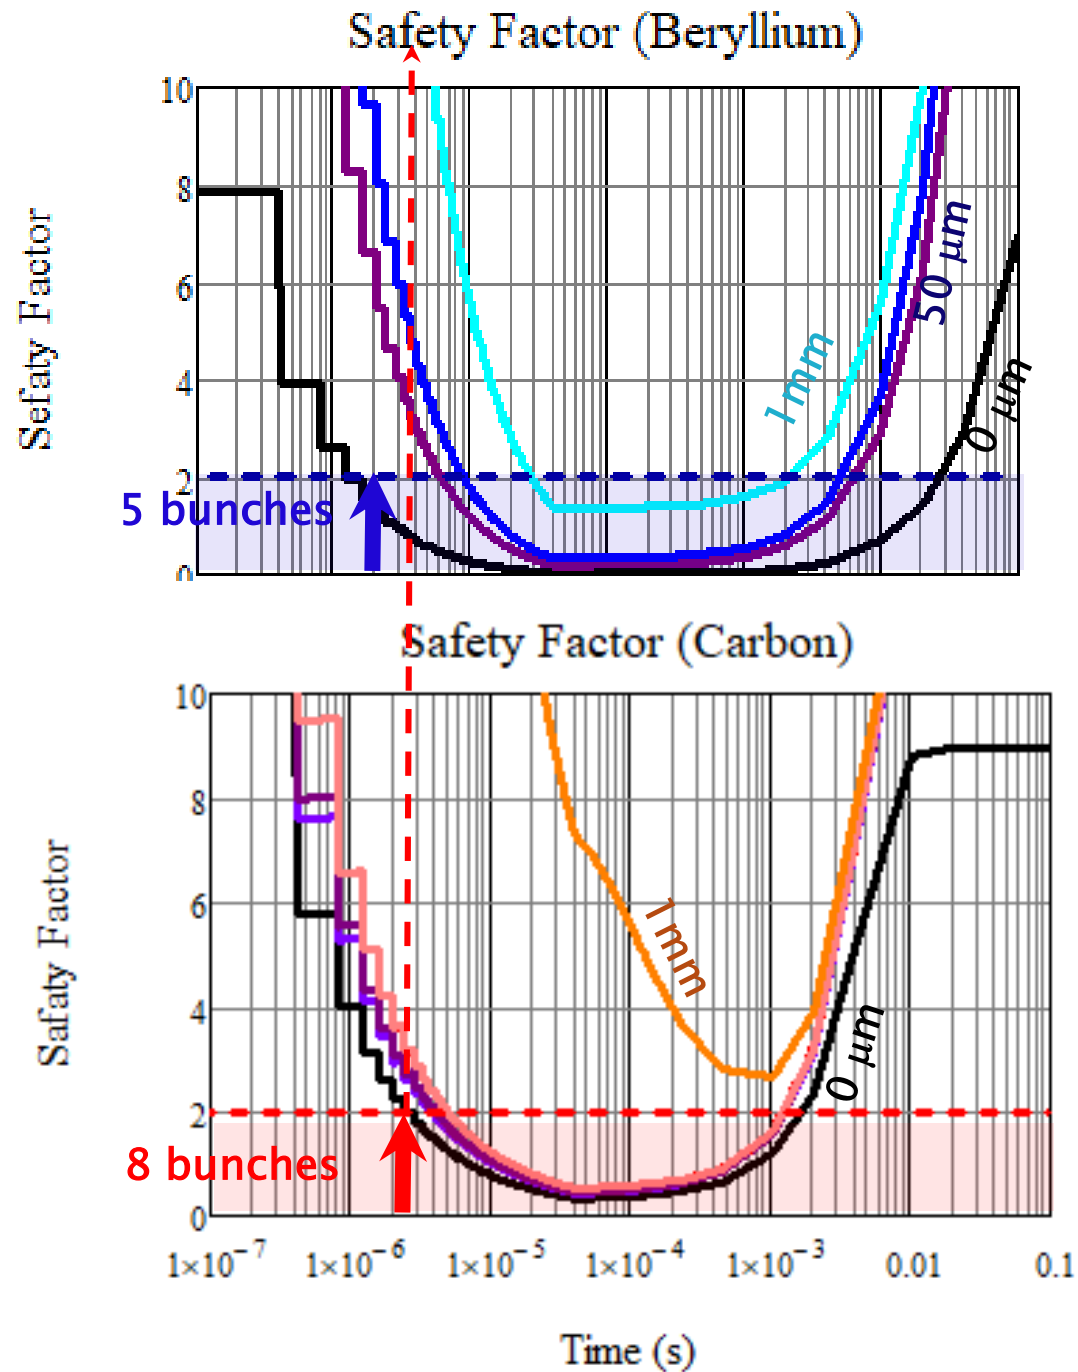

Equivalent Stress, MPa (Carbon)

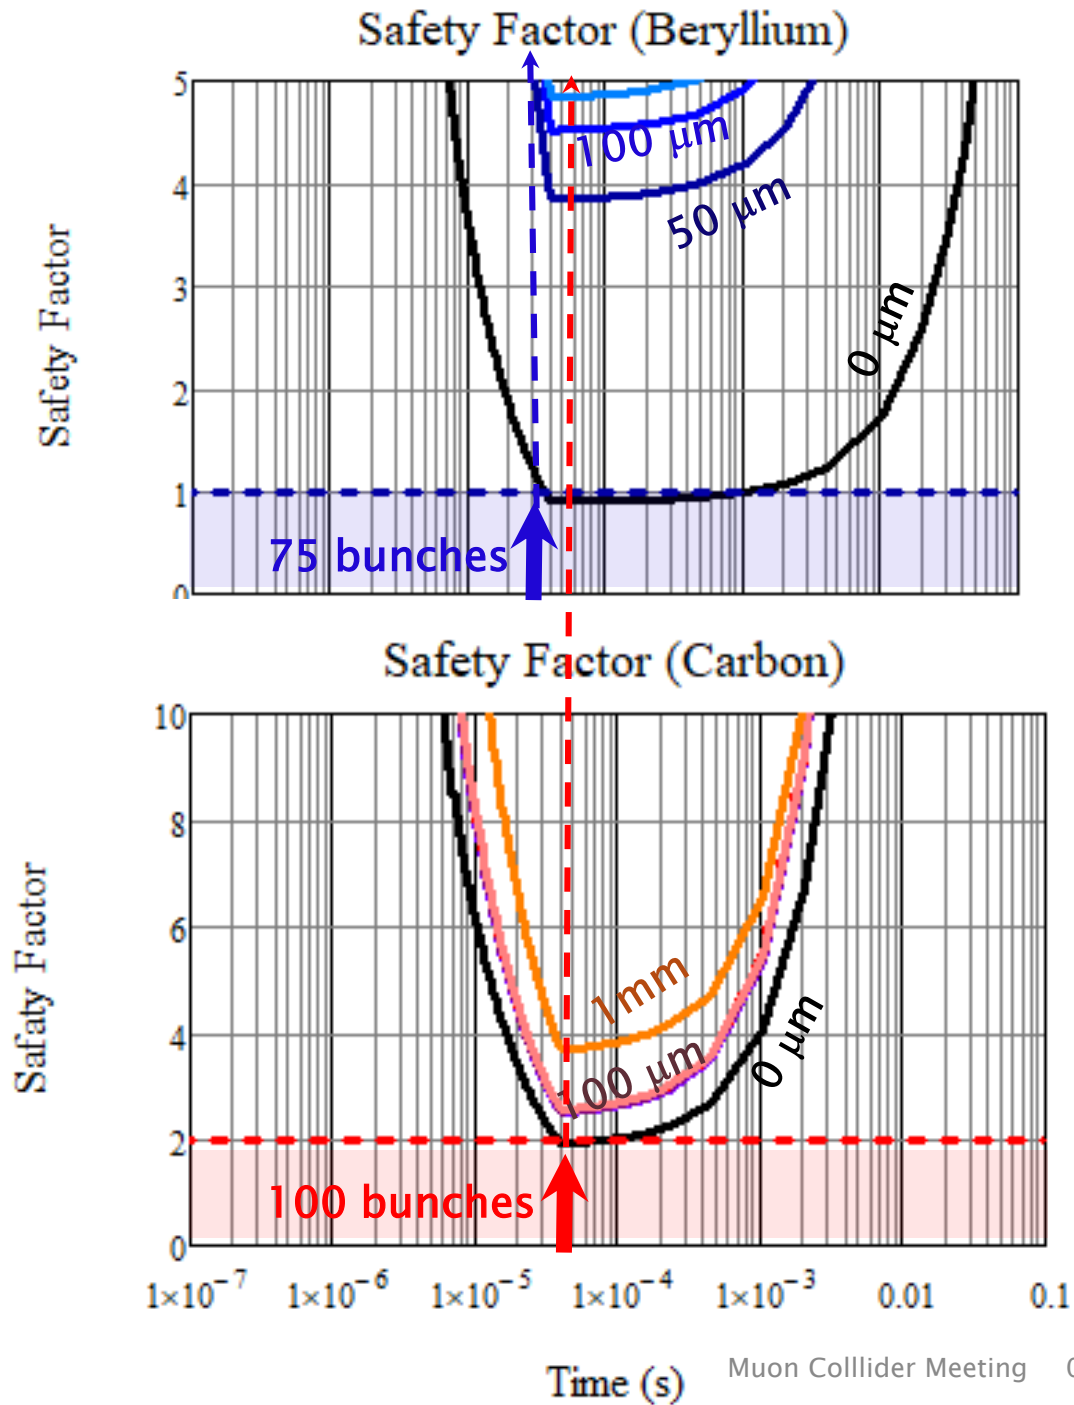

Spot 300  $\mu\text{m}$

$$\frac{\sigma_{uts}}{\sigma_e} > 2$$

Spot 1000  $\mu\text{m}$

$$\frac{\sigma_{uts}}{\sigma_e} > 2$$

# Conclusions

- ❑ We used the numerical model (FDTD) in order to evaluate the spatial and temporal gradients of temperature due to a single bunch or to sequence of bunches that can cause thermomechanical stresses and therefore damage or fractures of the target;
- ❑ We used the model based on the energy balance to obtain the steady state temperature and evaluate its sustainability both for a static configuration of the target.
- ❑ Future perspectives: characterization of the thermo elastic properties of solid targets. Real experiments by monitoring the temperature with an infrared camera

**Thanks for your attention**
