WP2 Meeting 25/02/2020

OUTLINE

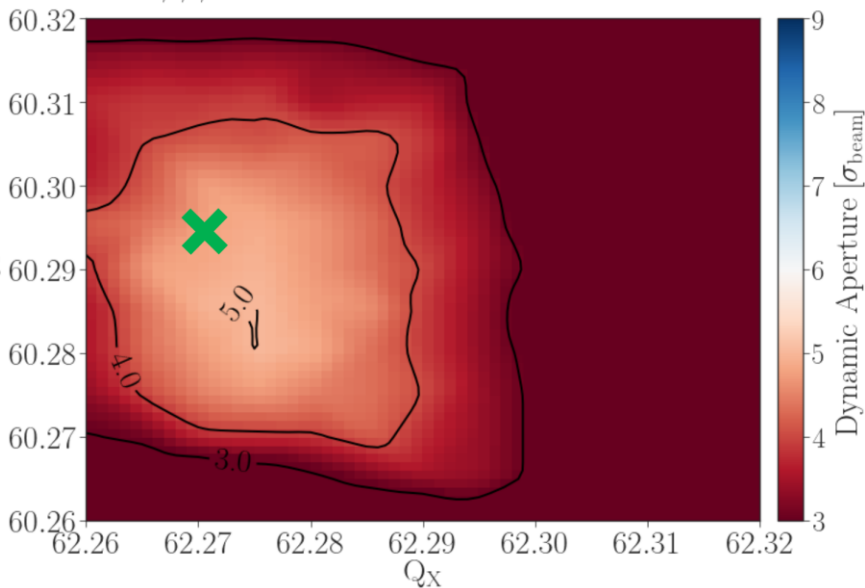

- ❑ Recall of previous simulations and observations
- ❑ Update on DA at injection including beam-beam
- ❑ Conclusions

Recall of previous simulations and observations

- ❑ Previous simulations presented in WP2 28/05/2019 (“HL-LHC Dynamic Aperture at Injection”) have shown an **important reduction of DA** with beam-beam between **LHC run III** and **HL-LHC (v1.3)** at injection and with **high octupole current** ($I_{MO} = 40$ A)
- ❑ The goal of the study is to understand the large difference observed

Courtesy of N. Karastathis

Min DA LHC, Injection, $N_b = 1.8 \times 10^{11}$ ppb, $\beta_{IP1/5}^* = 11$ m, $\beta_{IP2/8}^* = 10$ m
 $\phi_{IP1/2/5/8}/2 = 170$ μ rad, $\epsilon_n = 2.5$ μ m, $Q' = 15$, $I_{MO} = 40$ A

Min DA HL-LHC v1.3, Injection, $N_b = 2.2 \times 10^{11}$ ppb, $\beta_{IP1/5}^* = 6$ m, $\beta_{IP2/8}^* = 10$ m
 $\phi_{IP1/5/2} = 295$ μ rad, $\phi_{IP2/8/2} = 170$ μ rad, $\epsilon_n = 2.5$ μ m, $Q' = 20$, $I_{MO} = 40$ A

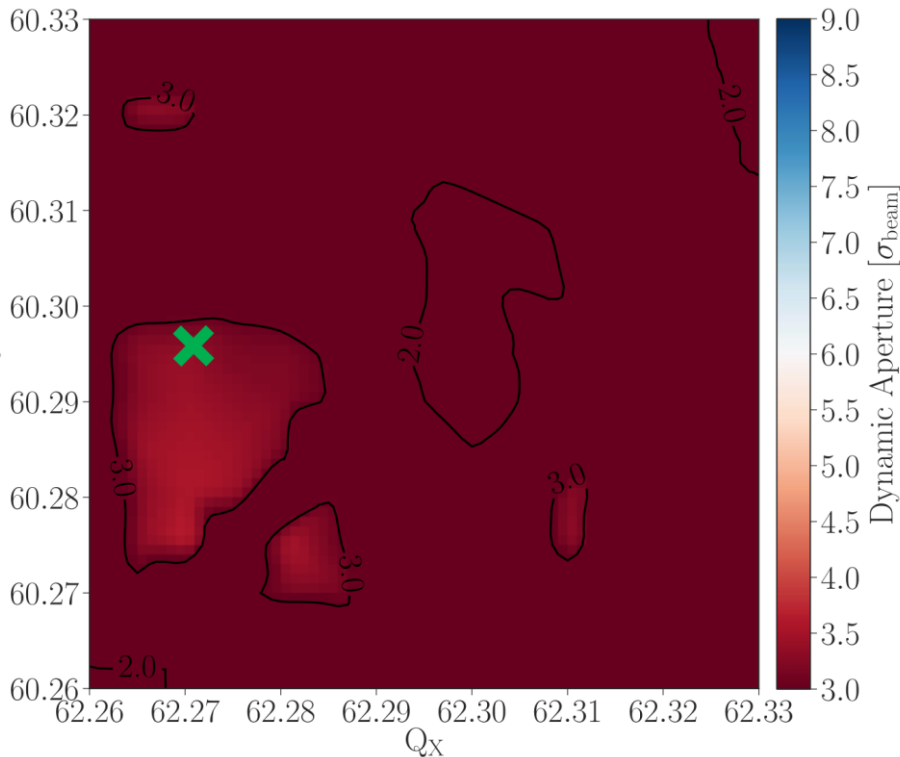

Recall of previous simulations and observations

- ❑ It was also shown that the **polarity of the octupoles change the location of the ‘good DA’ area**
- ❑ **Negative polarity gives better DA** but move the good tune area further from the optimal WP that was optimized for electron cloud

What makes the DA with octupoles much worse than LHC case?

Courtesy of N. Karastathis

Min DA HL-LHC v1.3, Injection, $N_b=2.2 \times 10^{11}$ ppb, $\beta_{IP1/5}^*=6$ m, $\beta_{IP2/8}^*=10$ m
 $\phi_{IP1/5}/2=295$ μ rad, $\phi_{IP2/8}/2=170$ μ rad, $\epsilon_n=2.5$ μ m, $Q^i=20$, $I_{MO}=40$ A

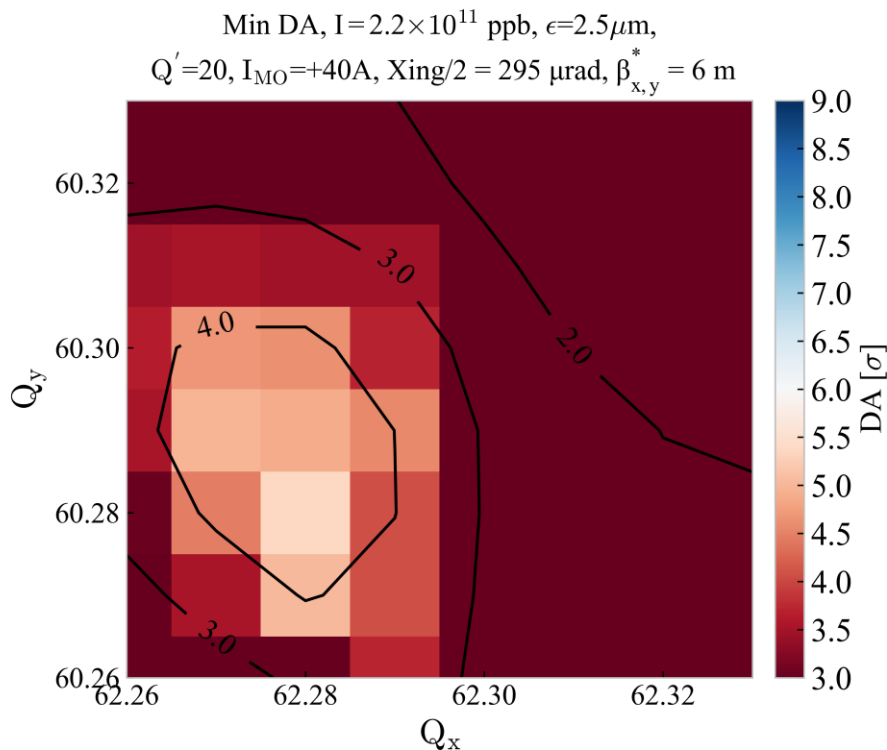

Min DA HL-LHC v1.3, Injection, $N_b=2.2 \times 10^{11}$ ppb, $\beta_{IP1/5}^*=6$ m, $\beta_{IP2/8}^*=10$ m
 $\phi_{IP1/5}/2=295$ μ rad, $\phi_{IP2/8}/2=170$ μ rad, $\epsilon_n=2.5$ μ m, $Q^i=20$, $I_{MO}=-40$ A

Update on DA at injection for HL-LHC

- ❑ The **simulation for HL-LHC at injection has been repeated** including beam-beam and for positive/ negative polarities (at 40 A) for HL-LHC v1.4
- ❑ However the **results show larger DA**, more similar to the LHC case.
- ❑ Also in the new simulation the **positive polarity of the octupole gives a better DA than the negative case**.

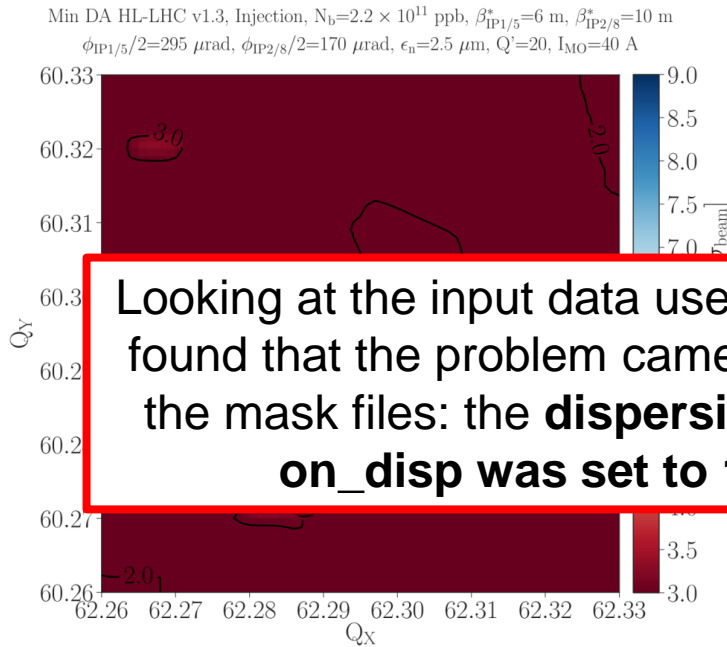

Update on DA at injection for HL-LHC

HL-LHC v1.3

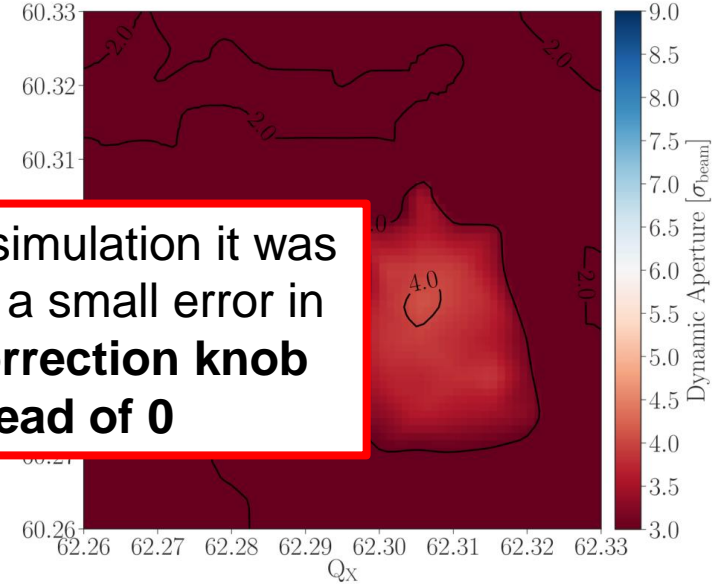

Injection

$I_{MO} = \pm 40$ A

Presented in
WP2 149th

Min DA HL-LHC v1.3, Injection, $N_b = 2.2 \times 10^{11}$ ppb, $\beta_{IP1/5}^* = 6$ m, $\beta_{IP2/8}^* = 10$ m
 $\phi_{IP1/5}/2 = 295$ μ rad, $\phi_{IP2/8}/2 = 170$ μ rad, $\epsilon_n = 2.5$ μ m, $Q' = 20$, $I_{MO} = -40$ A

HL-LHC v1.4

Injection

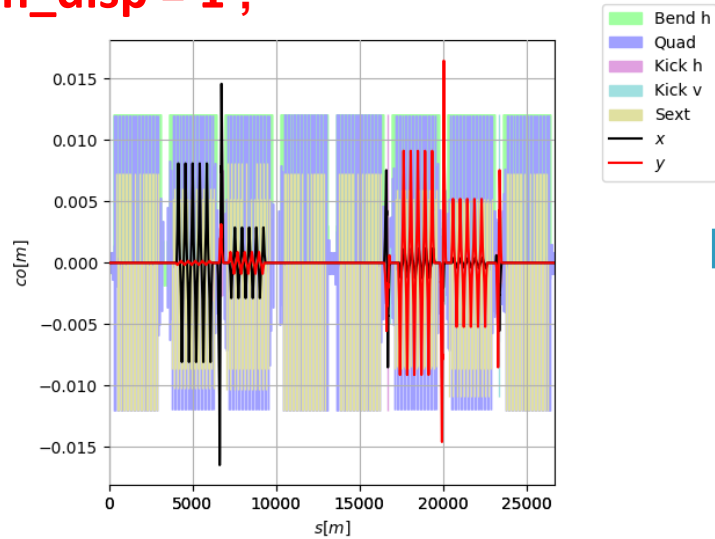

$I_{MO} = \pm 40$ A

Update on DA at injection for HL-LHC

- ❑ The dispersion correction knob should not be used at injection due to the large orbit bumps required for small dispersion correction

on_disp = 1 ;

on_disp = 0 ;

Update on DA at injection for HL-LHC

on_disp = 1 ;

HL-LHC V1.3
($I_{MO} < 0$)

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,
 $Q' = 20$, $I_{MO} = -40\text{A}$, $Xing/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ m}$

on_disp = 0 ;

HL-LHC V1.3
($I_{MO} < 0$)

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,
 $Q' = 20$, $I_{MO} = -40\text{A}$, $Xing/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ m}$

Update on DA at injection for HL-LHC

on_disp = 1 ;

HL-LHC V1.3
($I_{MO} > 0$)

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,
 $Q' = 20$, $I_{MO} = +40\text{A}$, $Xing/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ m}$

on_disp = 0 ;

HL-LHC V1.3
($I_{MO} > 0$)

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,
 $Q' = 20$, $I_{MO} = +40\text{A}$, $Xing/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ m}$

Update on DA at injection for HL-LHC

- ❑ The **octupole vs chromaticity scan** has been repeated and shows a clear asymmetry between positive and negative current for the **WP (62.27,60,295)**
- ❑ **DA in this case is much better for positive octupole current**

HL-LHC v.14 injection, Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,
 $X_{\text{ing}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6$ m, $(Q_x, Q_y) = (62.27, 60.295)$

Conclusions

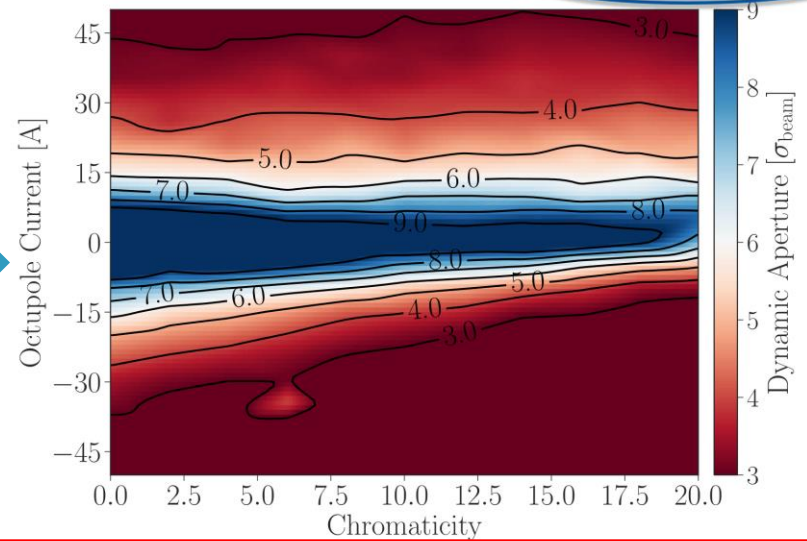

- ❑ The **DA at injection of the HL-LHC at high octupole current (± 40 A) is comparable to the LHC case**
- ❑ For the chosen WP (62.27,60.295), **positive current gives much better DA**
- ❑ The **change of location of the ‘good’ tune area** resulting from the change of octupole polarity is **observed also for the LHC case** (see Backup slides)

Comparison with/without disp. correction

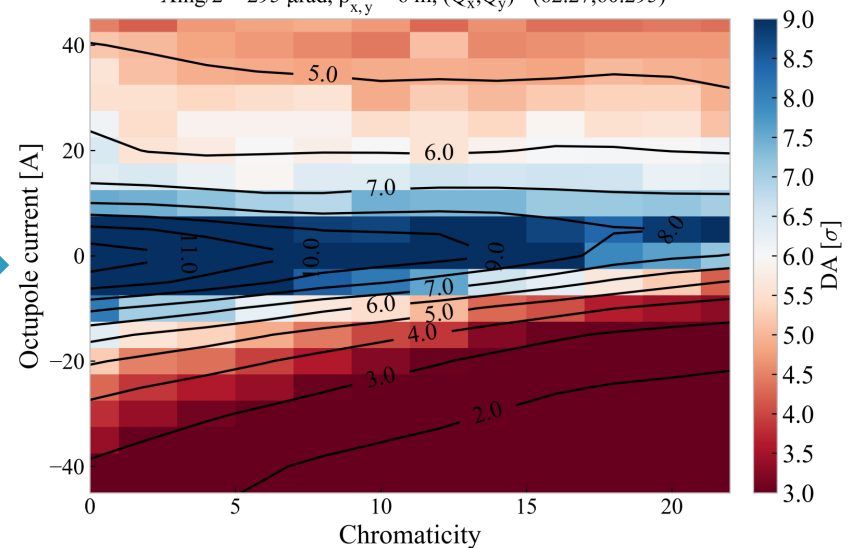

on_disp = 1 ;

Min DA HL-LHC v1.3, Injection, $N_b=2.3 \times 10^{11}$ ppb, $\beta_{IP1/5}^*=6$ m, $\beta_{IP2/8}^*=10$ m
 $\phi_{IP1/5}/2=295 \mu\text{rad}$, $\phi_{IP2/8}/2=170 \mu\text{rad}$, $\epsilon_n=2.5 \mu\text{m}$ ($Q_x, Q_y)=(62.270, 60.295)$

on_disp = 0 ;

HL-LHC v.14 injection, Min DA, $I=2.2 \times 10^{11}$ ppb, $\epsilon=2.5 \mu\text{m}$,
 $X_{\text{ing}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6$ m, $(Q_x, Q_y) = (62.27, 60.295)$

Comparison with/without Beam-Beam

HL-LHC v1.4

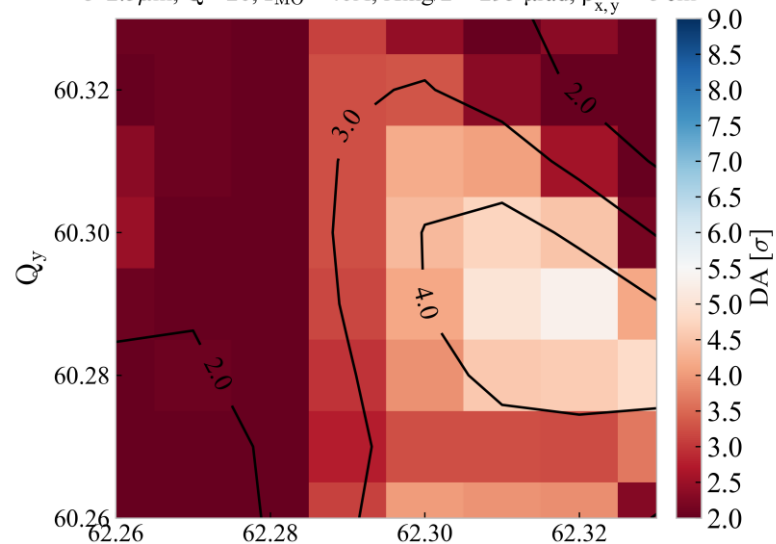

Injection

$I_{MO} = \pm 40$ A

No Beam-Beam

Min DA, $I = 2.2 \times 10^{11}$ ppb, $(Q_X, Q_Y) = (62.27, 60.295)$
 $\epsilon = 2.5 \mu\text{m}$, $Q' = 20$, $I_{MO} = -40$ A, $X_{ing}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6$ cm

HL-LHC v1.4

Injection

$I_{MO} = \pm 40$ A

With Beam-Beam

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,
 $Q' = 20$, $I_{MO} = -40$ A, $X_{ing}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6$ m

Comparison LHC vs HL-LHC (no beam-beam)

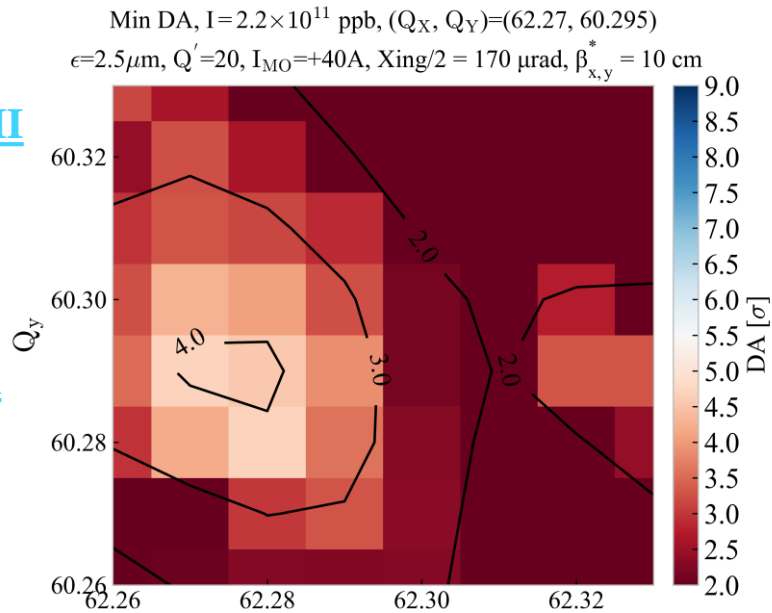

LHC run III

Injection

$I_{MO} = \pm 40$ A

No

BeamBeam

HL-LHC v1.4

Injection

$I_{MO} = \pm 40$ A

No

BeamBeam

Comparison $Q'=20$ & $Q'=15$

Min DA, $I = 2.2 \times 10^{11}$ ppb, $(Q_x, Q_y) = (62.27, 60.295)$

$\epsilon = 2.5 \mu\text{m}$, $Q' = 20$, $I_{MO} = +40\text{A}$, $X_{\text{ing}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ cm}$

HL-LHC v1.4

Injection

$I_{MO} = \pm 40 \text{ A}$

$Q' = 20$

Min DA, $I = 2.2 \times 10^{11}$ ppb, $(Q_x, Q_y) = (62.27, 60.295)$

$\epsilon = 2.5 \mu\text{m}$, $Q' = 20$, $I_{MO} = -40\text{A}$, $X_{\text{ing}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ cm}$

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,

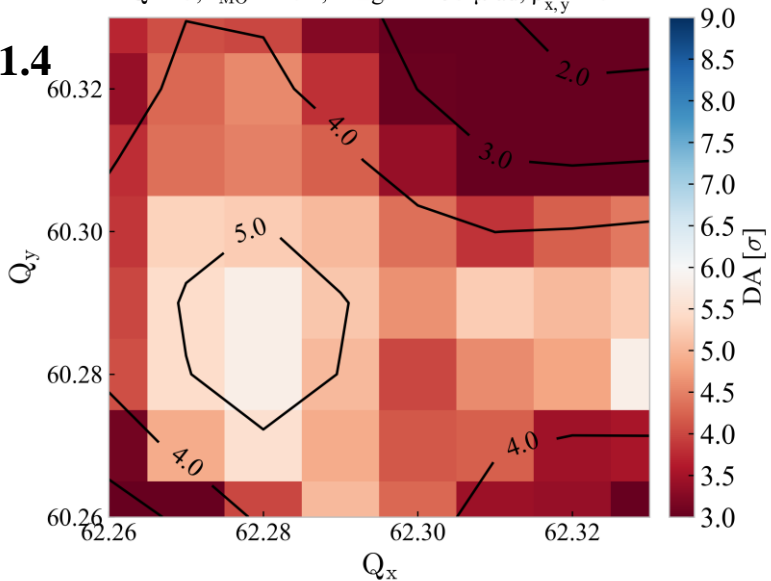

$Q' = 15$, $I_{MO} = +40\text{A}$, $X_{\text{ing}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ m}$

HL-LHC v1.4

Injection

$I_{MO} = \pm 40 \text{ A}$

$Q' = 15$

Min DA, $I = 2.2 \times 10^{11}$ ppb, $\epsilon = 2.5 \mu\text{m}$,

$Q' = 15$, $I_{MO} = -40\text{A}$, $X_{\text{ing}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ m}$

Comparison of sextupole powering

Min DA, $I = 2.2 \times 10^{11}$ ppb, $(Q_x, Q_y) = (62.27, 60.295)$
 $\epsilon = 2.5 \mu\text{m}$, $Q' = 20$, $I_{MO} = +40\text{A}$, $X_{\text{ring}}/2 = 295 \mu\text{rad}$, $\beta_{x,y}^* = 6 \text{ cm}$
