# VidyoConnect Call Flow

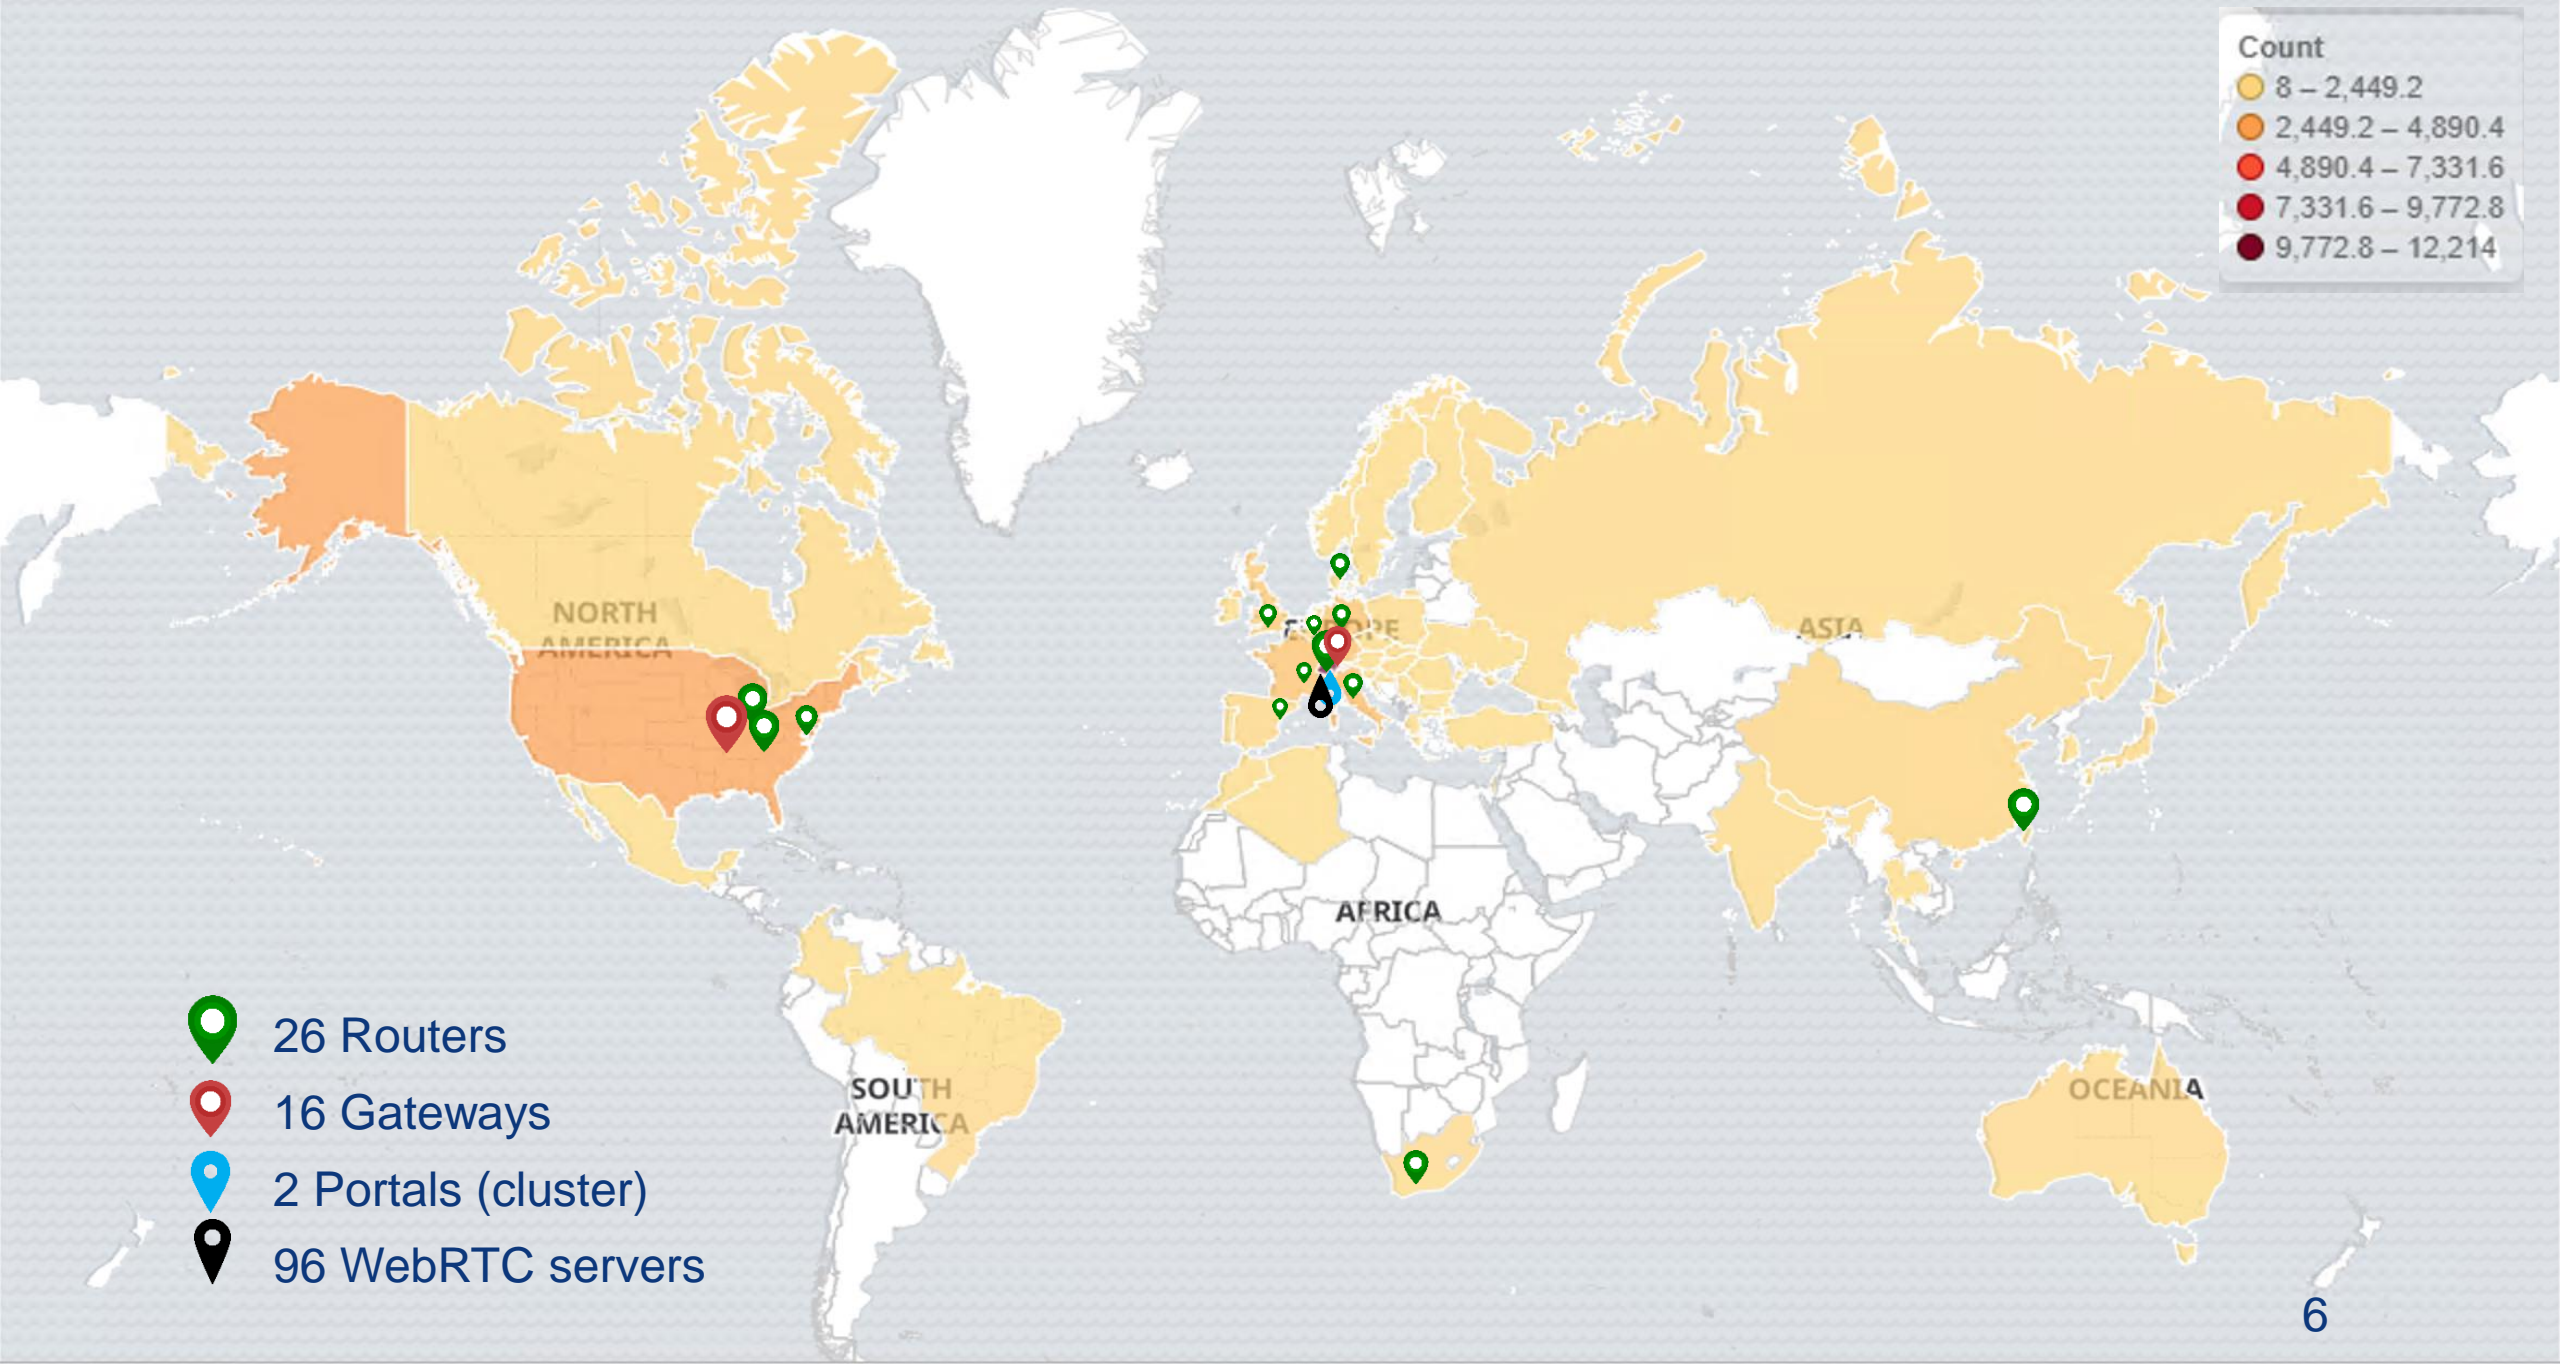

\*from <https://support.vidyocloud.com/>

# WebRTC call (permissive NAT)

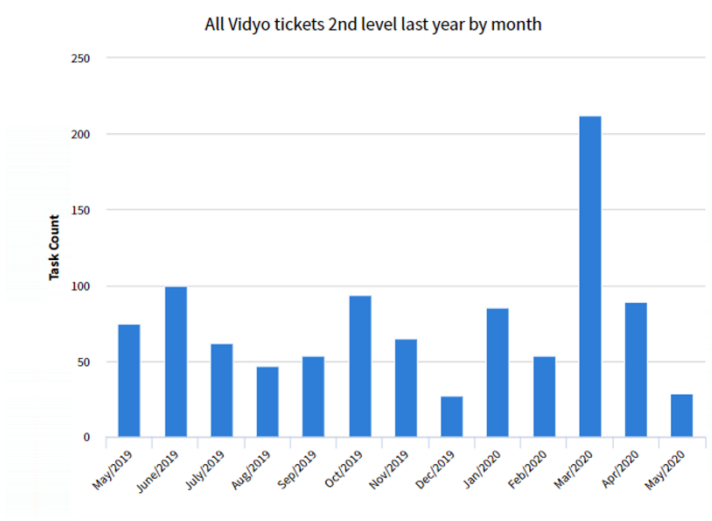

from <https://support.vidyocloud.com/>

# Initial situation

- Servers **running** different versions of **Ubuntu**
  - Images provided by Vidyo
  - A **new image** usually **removes previous customization**
- Servers scattered **around the world**
  - Difficulties to manage them e.g. console session
- **Vendor doesn't provide** tools to **monitor** on premise infrastructure (portal)
  - system monitoring missing
- **No clue** about traffic, load on different components, meetings distributions
  - 2<sup>nd</sup> level support is quasi blind (using old drupal dashboard)
  - 3<sup>rd</sup> level support SQL queries against CDR to extract information
- **Support cases** usually very **complex** to solve e.g. audio issues, sharing, split brain meetings, gathering client logs, server logs,..

# Outline

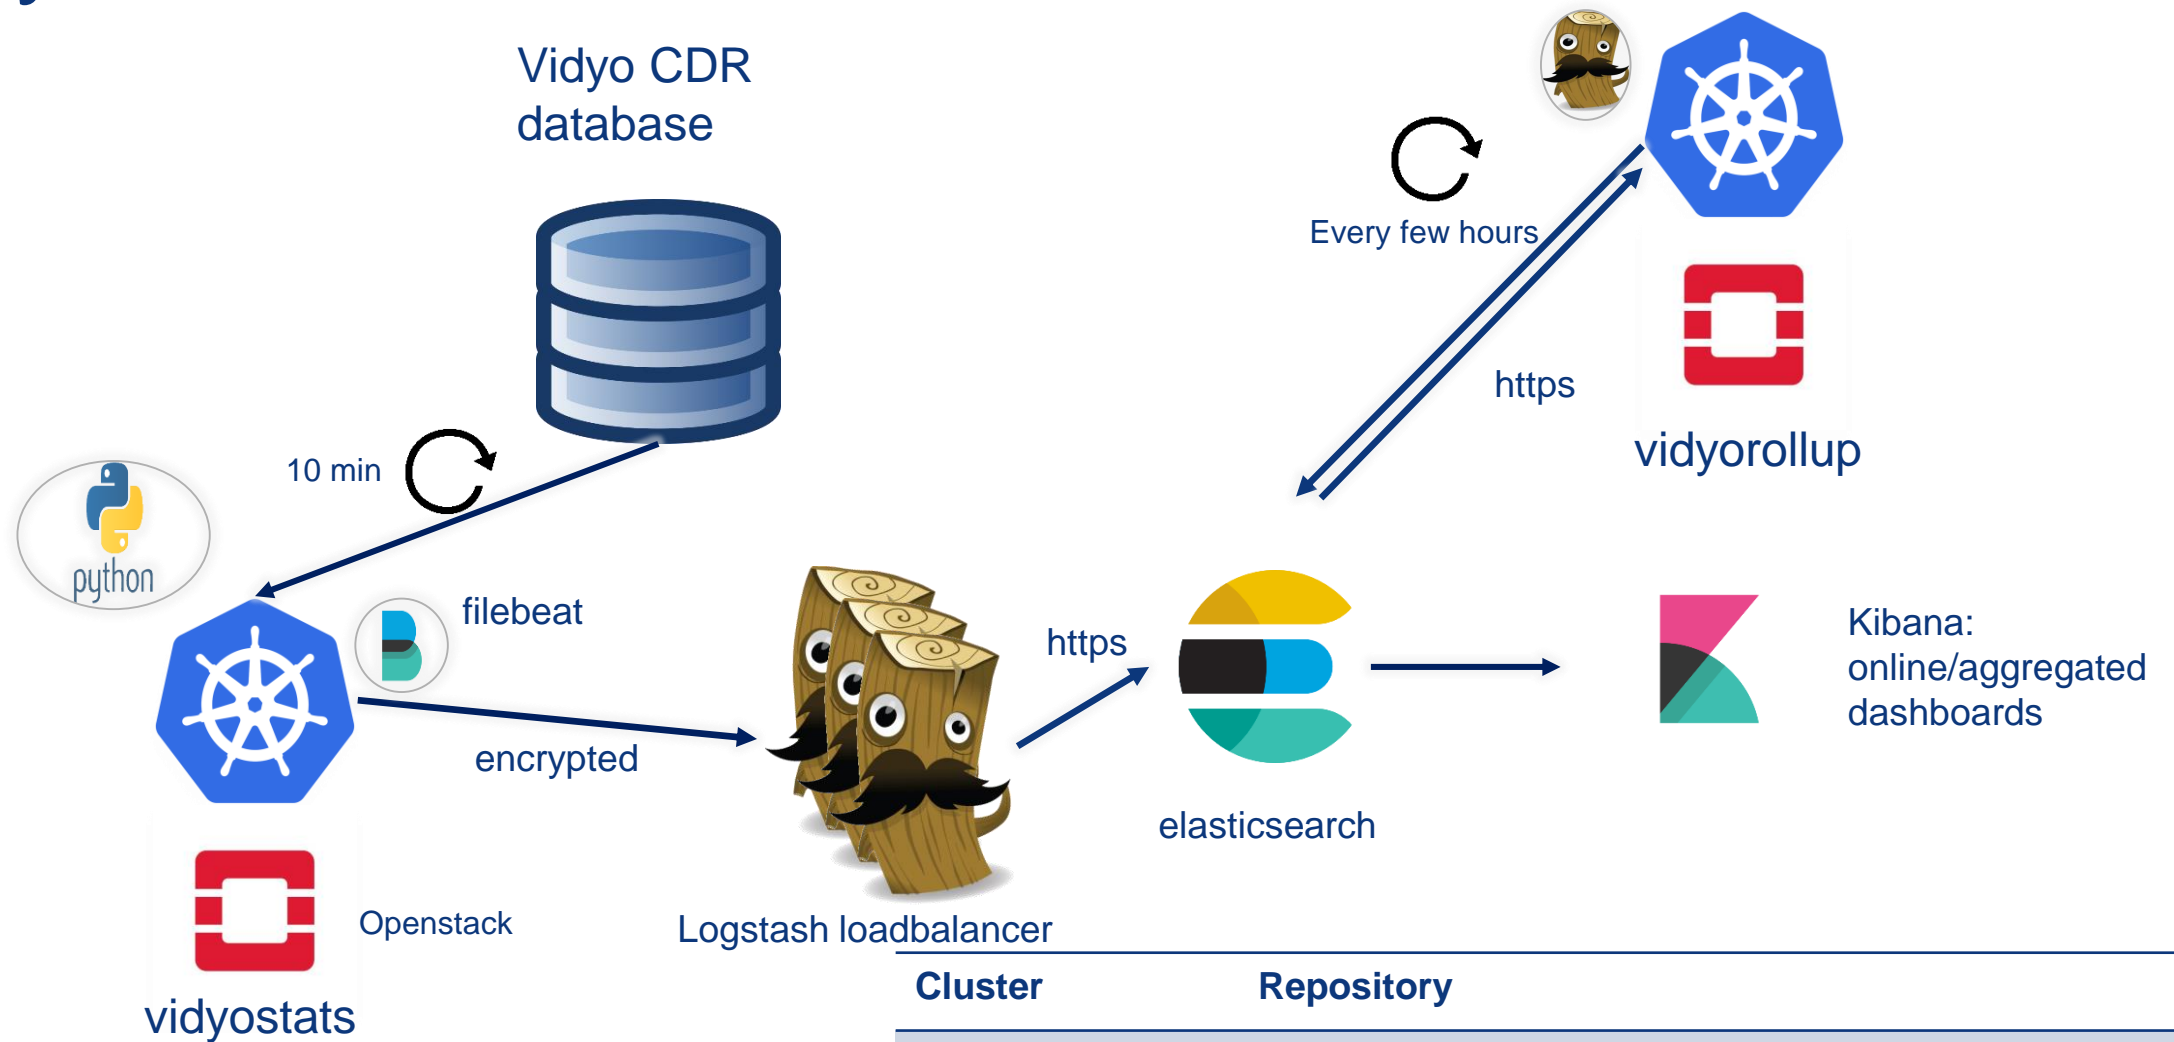

- Quick intro to Vidyo conference system and CERN setup
- **Solution principles & architecture**
  - **Online and aggregated dashboards**
- Metrics architecture
- Conclusions

# eXtreme monitoring principles for Vidyo

- Avoid nice to have for **essential** to have
- **Reuse** infrastructure e.g. logstash load balancer, ES cluster, etc.
- Code as little as possible → the less to debug the better
- **Prepare the data** so you can get meaningful visualizations → nosql document based records (pre-joined)
- **Ease maintenance** as much as possible
  - Use IT central services as much as possible
- **Target your audience**: service managers and 2<sup>nd</sup> level supporters
- It should be **GDPR** compliant

# Outline

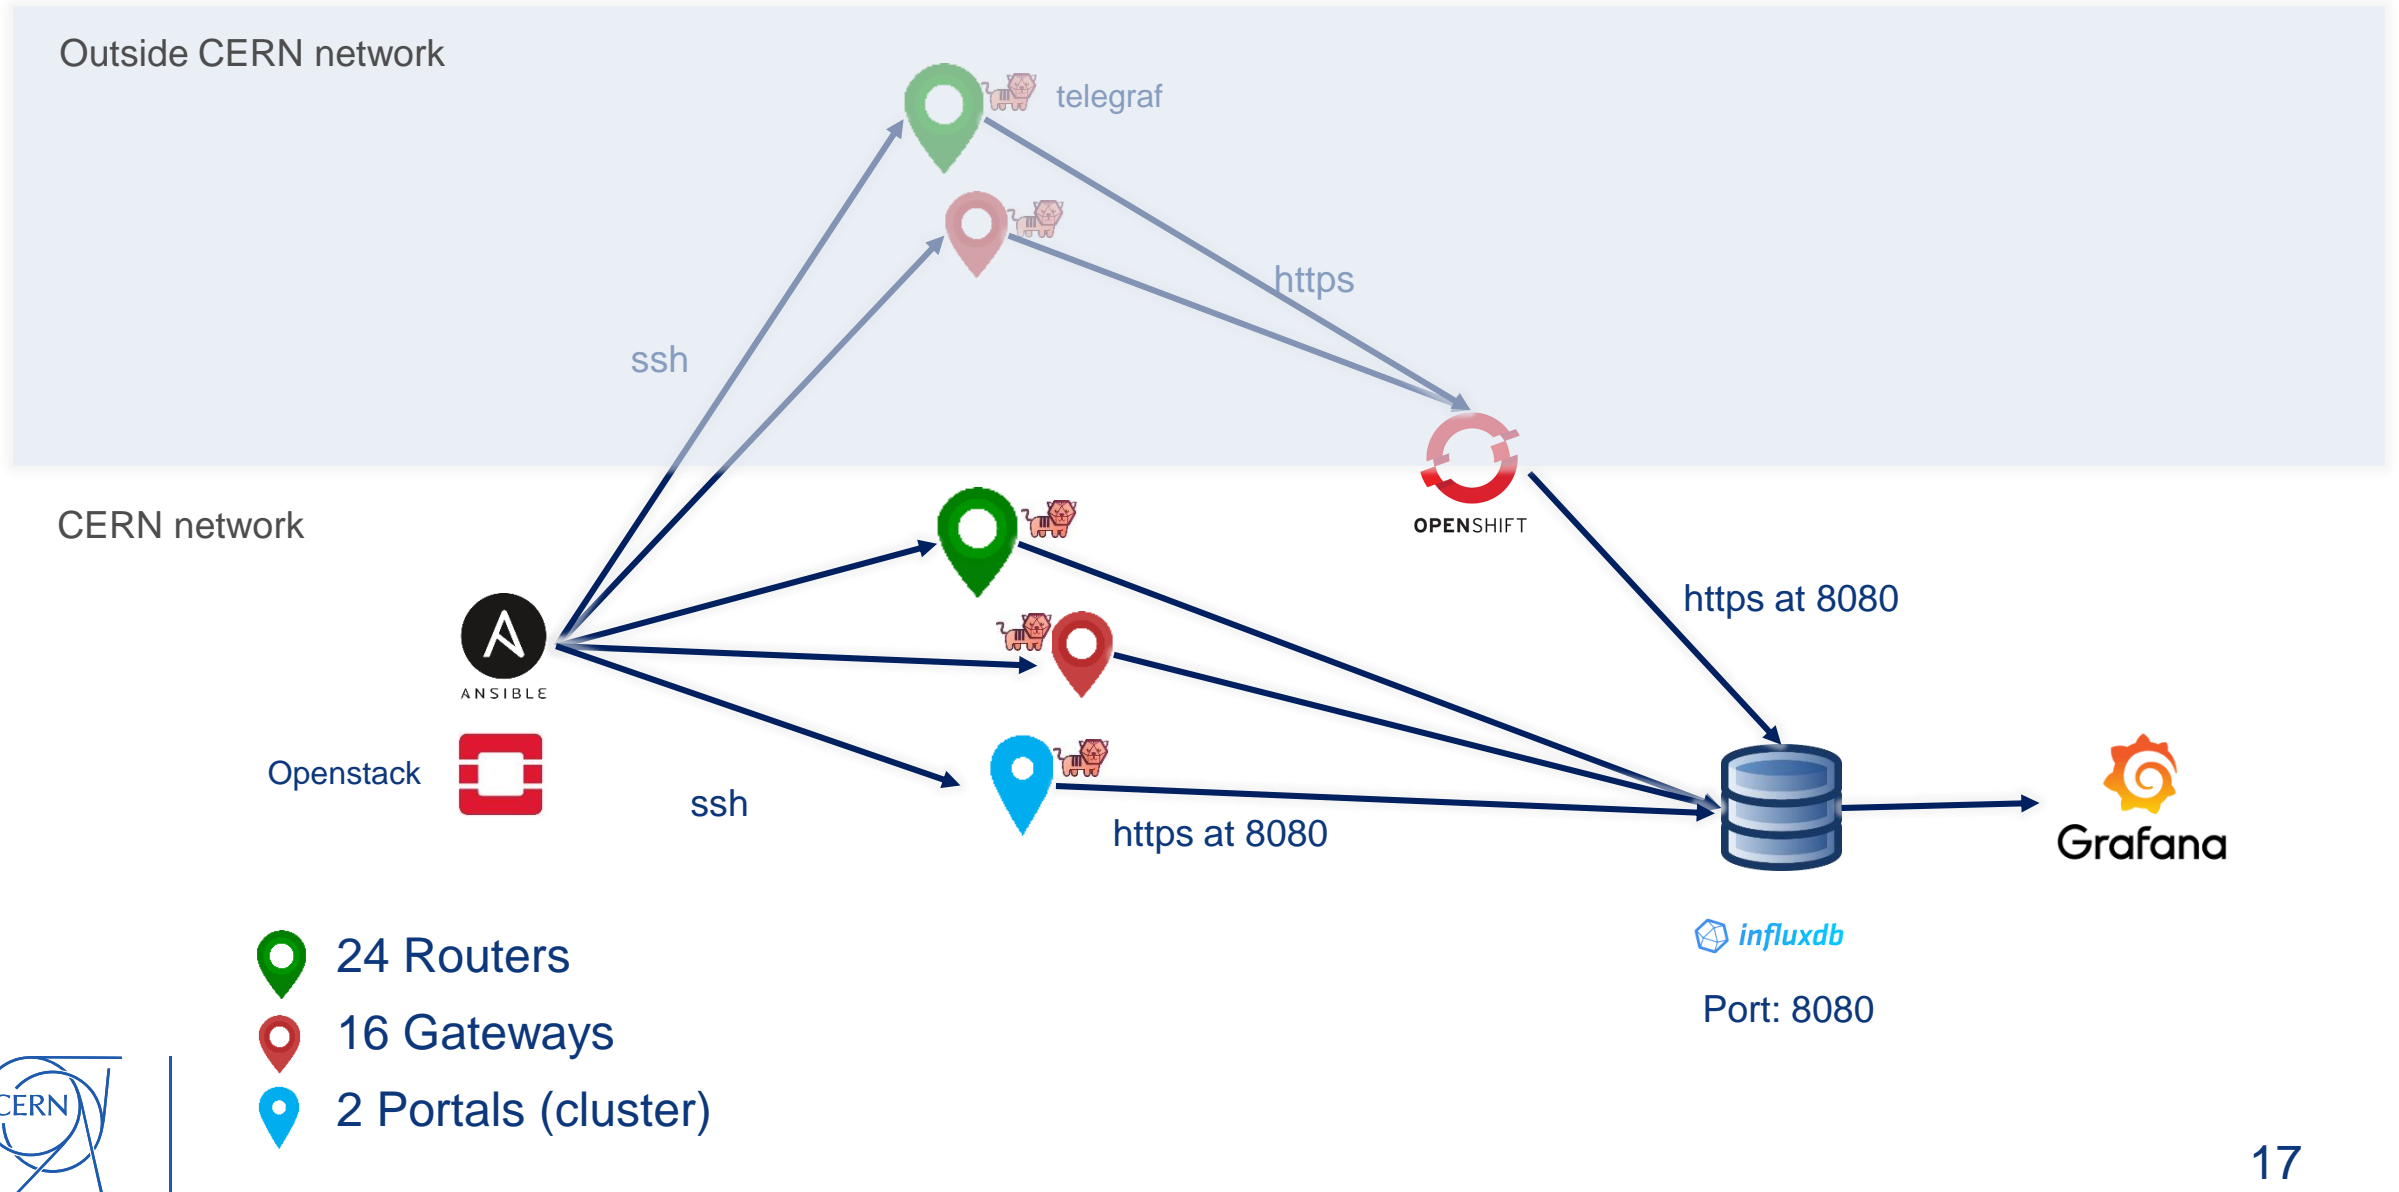

- Quick intro to Vidyo conference system and CERN setup
- Solution principles & architecture
  - Online and aggregated dashboards
- **Metrics architecture**
- Conclusions

# Metrics monitoring

- Based on [telegraf/influxdb/grafana](#)
- [Ansible roles](#) for deployment
- Alerts via email & [mattermost](#) channel
- [Openshift bridge](#) for outside CERN servers
- [Monitor](#) important [processes](#) from Vidyo e.g. gwcc

# Metrics collector architecture

# Internet2 gateway issue - OTG0050828

- US deployed gateway running on VMWare
  - No ssh access to the underlying hypervisor
  - Pretty complicated to debug
- Thanks to metrics monitoring, solved by sending a disk instead of a full server

# Other contexts

- E-mail: Exchange or Kopano
- Windows Terminal servers
- IoT

Let's do a quick demo!

# Outline

- Quick intro to Vidyo conference system and CERN setup
- Solution principles & architecture
  - Online and aggregated dashboards
- Metrics architecture
- **Conclusions**

# Conclusions

- A **data driven approach** used in both cases
  - Almost **agnostic** of the domain/type of the devices to be monitored
- Very **flexible design** that allows to enrich the apps with new functionality/needs
- Pushing maintenance of the infrastructure to **IT central services** as much as possible
- Parts of the **architecture** being **reused** by other services e.g. Terminal service, Conversion service, Email service.
