

HFLAV Tau status

Alberto Lusiani

February 18, 2020

review by Matthias Jamin

- comments received on 15 January 2020
- all fine, no modifications required

review by Klaus Moenig

- comments received on 6 January 2020
- answered on 29 January 2020
 - text updated on overleaf

- clarified the fact that some constraints are valid to a good approximation under present measurement uncertainties
- some results use unitarity constraint on sum of branching fractions
 - what are the implications in a non-unitarity constraint fit
 - no obvious answer
- R_{had} non-standard definition is now better motivated
 - added text and calculations for two traditional R_{had} definitions (e.g. $R_{\text{had}} = (1 - B_e - B_\mu)/B_e$)
- added a comment of how correlation between lattice QCD f_K and f_K/f_π affects V_{us} average

Thanks for your attention!
