New physics in B meson mixing: future sensitivity and limitations

Luiz VALE SILVA (IFIC, UV - CSIC)

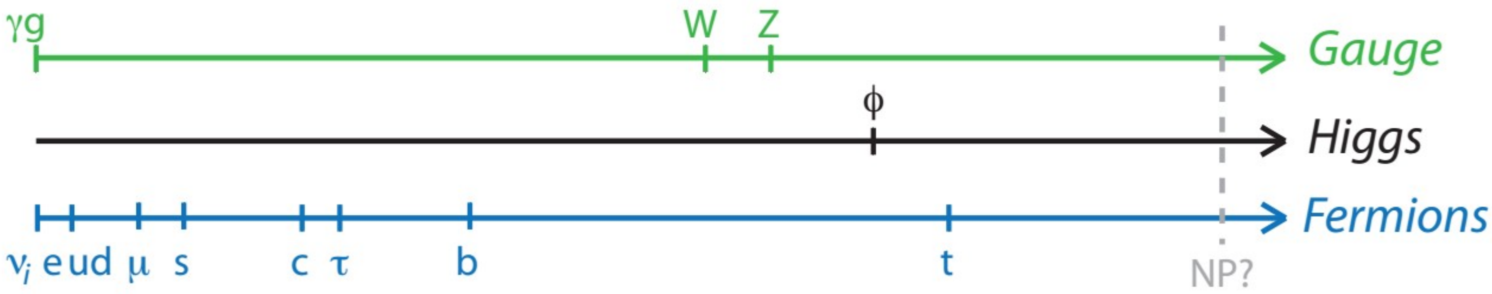
[Charles, Descotes-Genon, Ligeti, Monteil, Papucci, Trabelsi, LVS, PRD 102, 056023 (2020), arXiv:2006.04824]

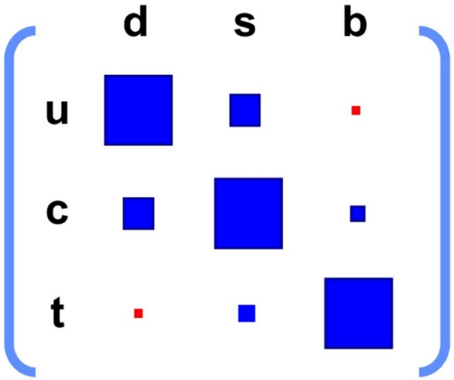
CKM 2021, Melbourne (virtual), 22-26 November 2021

The Standard Model (SM) and Beyond

- **Flavour physics played a central role in the formulation of the SM (new fermion generations, manifestation of CP Violation, etc.)**
- **Many flavour observables enjoy the status of *precision physics*, thanks to progress in different fronts (e.g. QCD inputs)**
- **Flavour physics can play a leading role in addressing the questions left open by the SM, and reveal New Physics sectors**

Hierarchies in the spectrum of particles and CKM matrix:

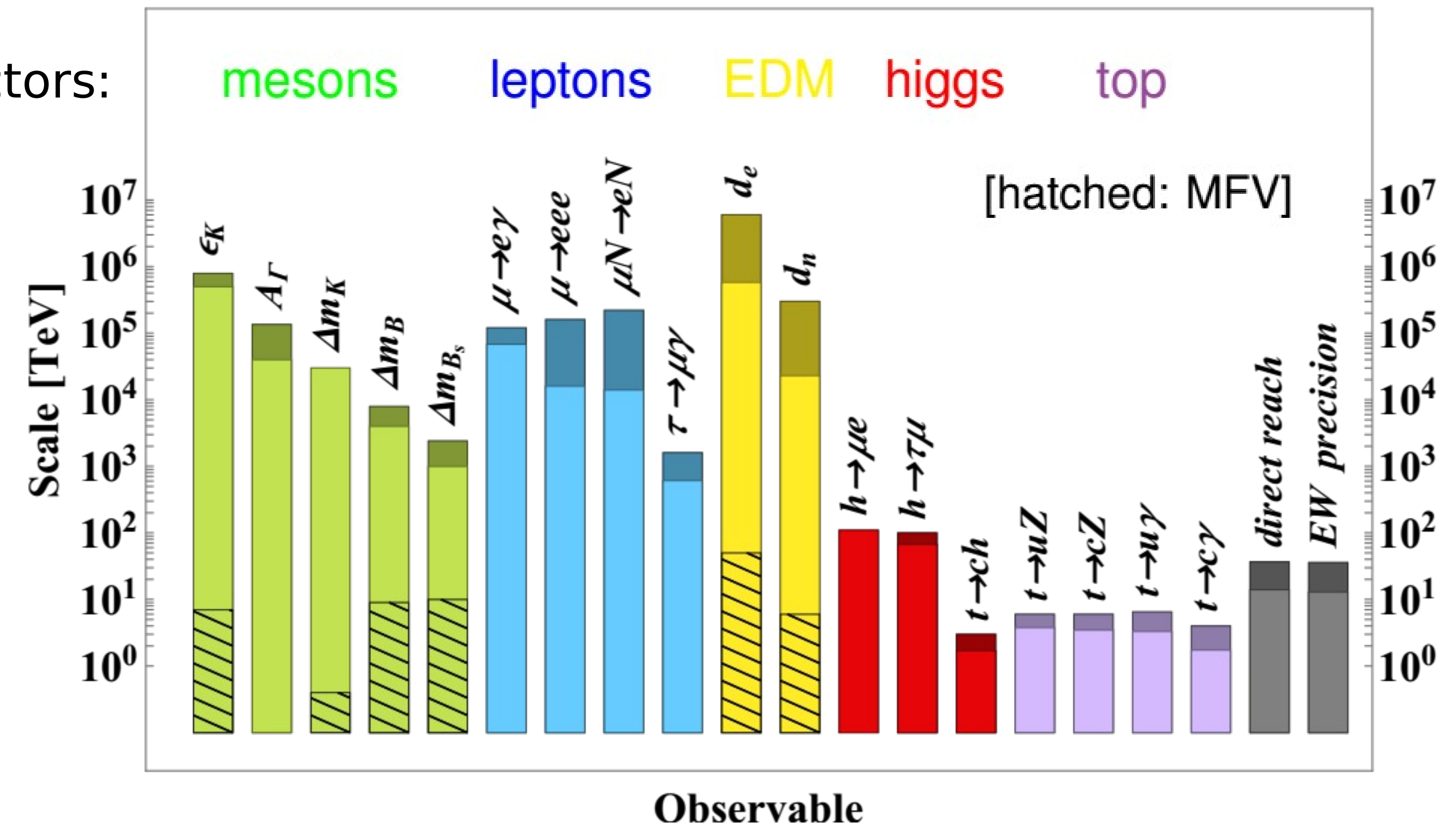




Reach to New Physics (NP)

- **Low-energy observables → probe energy scales much beyond the reach of direct searches**
- **The bounds derived shape NP candidates**
- **If deviation seen, possible NP manifestation!**

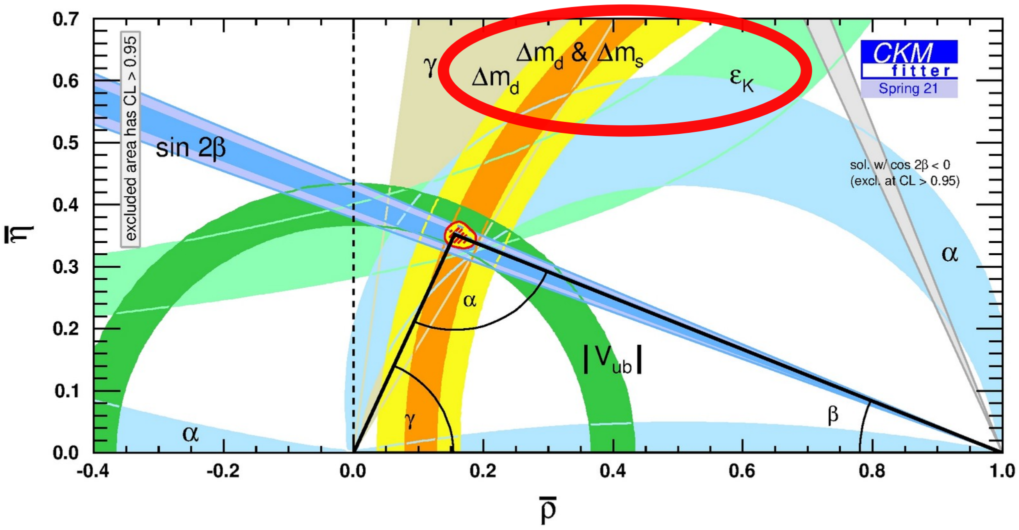
Different sectors:



[European Strategy Update 2020, arXiv:1910.11775]

Current status of flavour

- **Overall agreement w/ the SM, but some exciting tensions (e.g. "B-anomalies")**



[CKMfitter update as of Spring '21: see talk later today by Wenbin Qian]

- **Flavour is one of the main physics cases for future experiments**
- **Future data will guide the field, testing present anomalies and possibly revealing new ones**

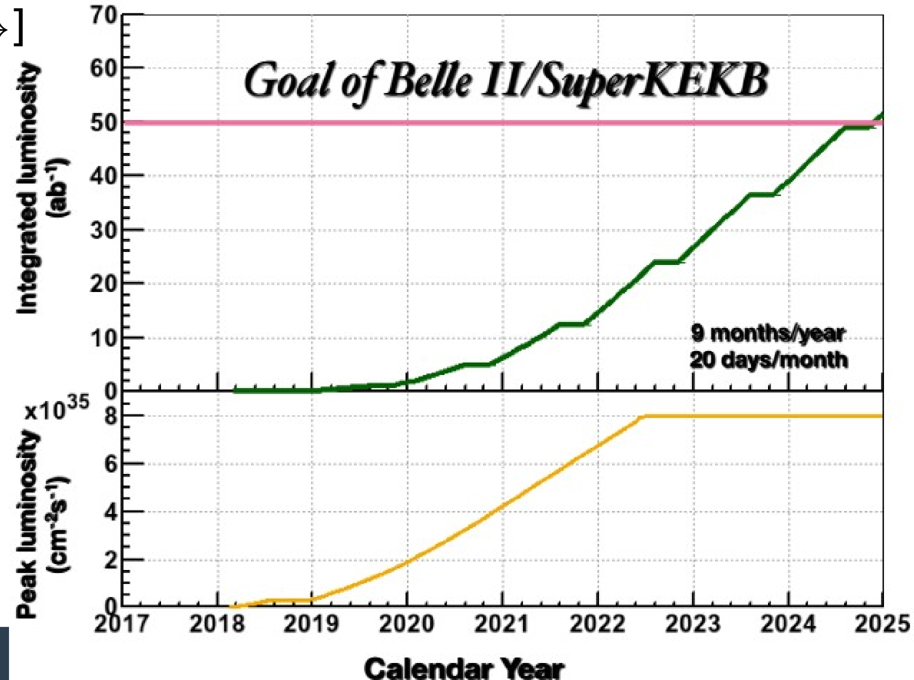
New era of flavour ahead

	LHC era			HL-LHC era	
	Run 1 (2010-12)	Run 2 (2015-18)	Run 3 (2021-24)	Run 4 (2027-30)	Run 5+ (2031+)
ATLAS, CMS	25 fb^{-1}	150 fb^{-1}	300 fb^{-1}	⟶	3000 fb^{-1}
LHCb	3 fb^{-1}	9 fb^{-1}	23 fb^{-1}	50 fb^{-1}	*300 fb^{-1}

* assumes a future LHCb upgrade to raise the instantaneous luminosity to $2x10^{34}$ $cm^{-2}s^{-1}$

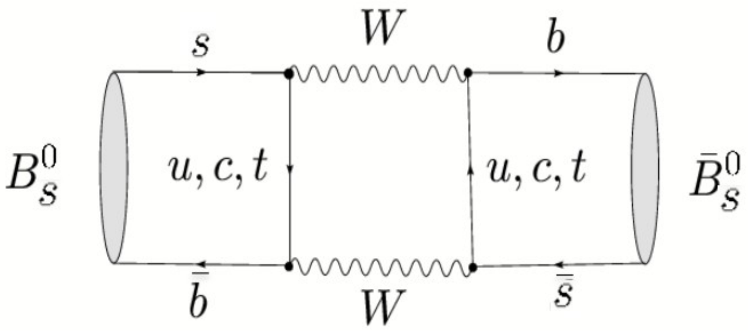
[↑ See arXiv:1808.08865] [From arXiv:1808.10567 →]

- **Expression of interest for an LHCb Upgrade II**
- **Belle II: 50x the Belle and nearly 100x the BaBar data sets; ongoing discussions about upgrade**



NP in B meson mixing

- **HERE we address <u>present and future bounds</u> on NP in |ΔB|=2, and discuss <u>future limitations</u>**
- **|ΔB|=2: NP competes with suppressions in the SM (GIM/loop), and enjoy the status of precision physics**



- **Not discussing K, nor D meson mixing**

[See: PRD 89, 033016 (2014), arxiv:1309.2293]

- **Combine projections for future data: need global fit including “tree” and “loop” observables**

[see e.g. CKMfitter]

NP in B meson mixing

- **NP in |ΔB|=2:**

  h_d and h_s set sizes

Bag parameters,
↓ decay constants

$$M_{12} = M_{12}^{\mathrm{SM}} \times (1 + h\, e^{2i\sigma})$$

↑ ↗
NP parameters

- **Assumptions:**
  - No NP in |ΔF|=1:

    tree level in SM (γ, $|V_{ub}|$, $|V_{cb}|$, ...) free of NP
  - NP is short-distance
  - Unitarity of the CKM 3x3 matrix
  - Unrelated NP in B_d and B_s systems

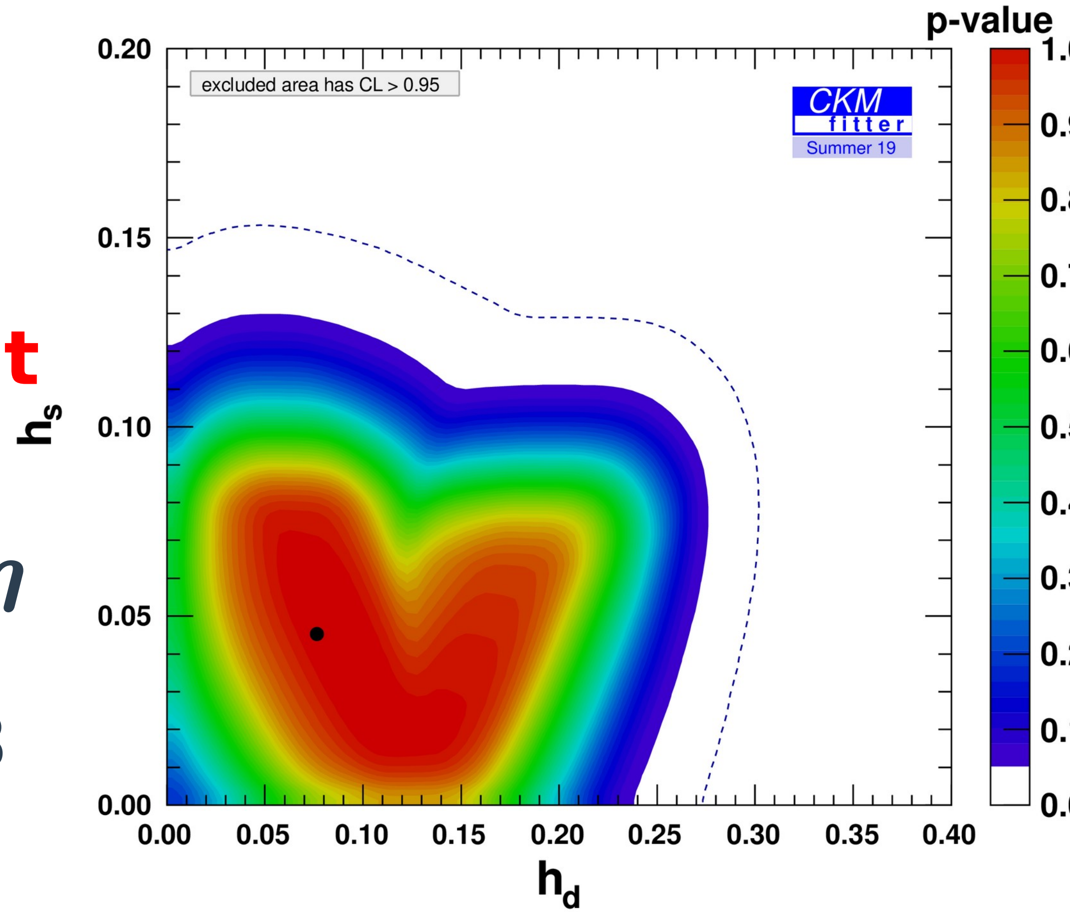
[See: PRD 89, 033016 (2014), arxiv:1309.2293]

- **SMEFT: four-quark operators of different chiral structures**

Present status of NP in B meson mixing

- **Agreement with the SM ($h_d=h_s=0$) at ~1σ**
- **Allowed size for NP at the level of O(20%)!**
- **Extractions of ρ and η (Wolfenstein parm.) degrade by factor ~3**

Status as of Summer '19



Black dot: best fit point; σ_d and σ_s are unconstrained

Benchmarks for the future

- **Phase I**: **LHCb-upgrade I 50/fb, & Belle II 50/ab (late 2020s)**
- **Phase II**: **LHCb-upgrade II 300/fb, & Belle II upgrade 250/ab (late 2030s)**
- **Phase III**: **Phase II + FCC-ee**

FCC-ee: initial phase of FCC; operates at different EW thresholds: **5×10^{12} Z bosons**, **10^8 WW pairs**, >10^6 Higgses, >10^6 tt pairs

Table S.4 Expected production yields for b-flavoured particles at FCC-ee at the Z run, and at Belle II (50 ab^{-1}) for comparison

Particle production (10^9)	$B^0/\bar{B}^0$	B^+/B^-	$B^0_s/\bar{B}^0_s$	$\Lambda_b/\bar{\Lambda}_b$	$c\bar{c}$	$\tau^+\tau^-$
Belle II	27.5	27.5	n/a	n/a	65	45
FCC-ee	1000	1000	250	250	550	170

and EPJPlus 136, 912 arXiv:2106.12168]

Experimental and theoretical inputs

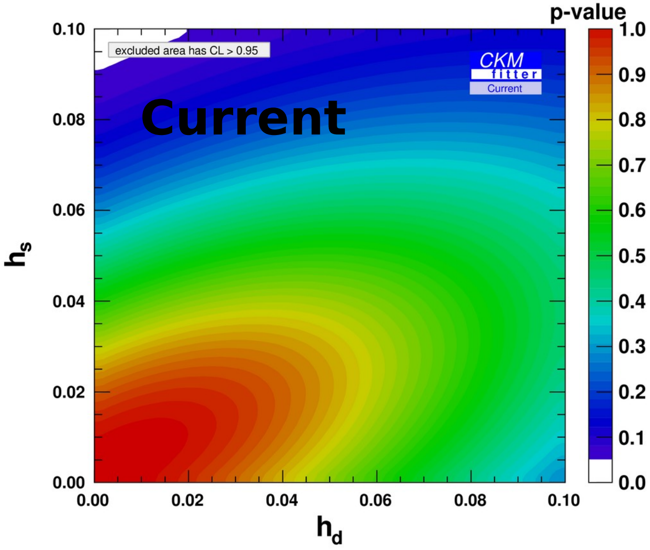
- **Caveat: many experimental sensitivity studies are simplistic or not yet available**
- **$|V_{ub}|_{SL}$ & $|V_{cb}|_{SL}$: dominance of stat. uncs. (Belle II)**

  $|V_{cb}|$ accuracy ~0.4% @ FCC-ee: $W \to bc$ [Schune, Monteil]

- **Future accuracy in angles (α, β, β_s, γ) ~< 1°**
- **Phases I and II uncs. for Lattice QCD (form-factors, bag parameters) < 1%**

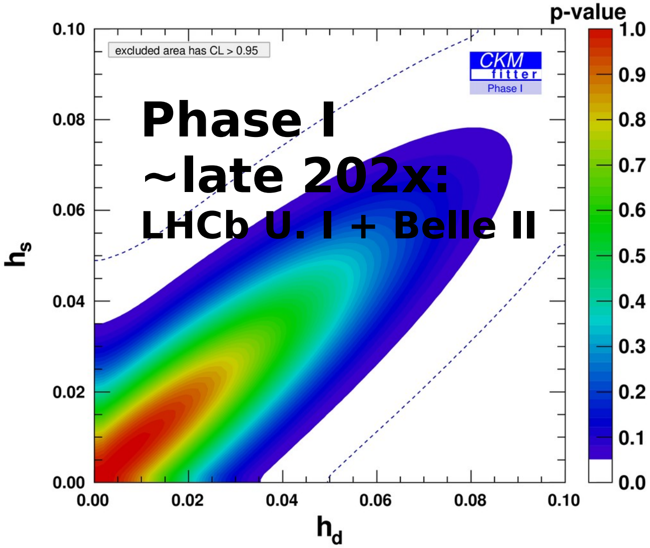
  Literature discusses Lattice QCD projections up to Phase II

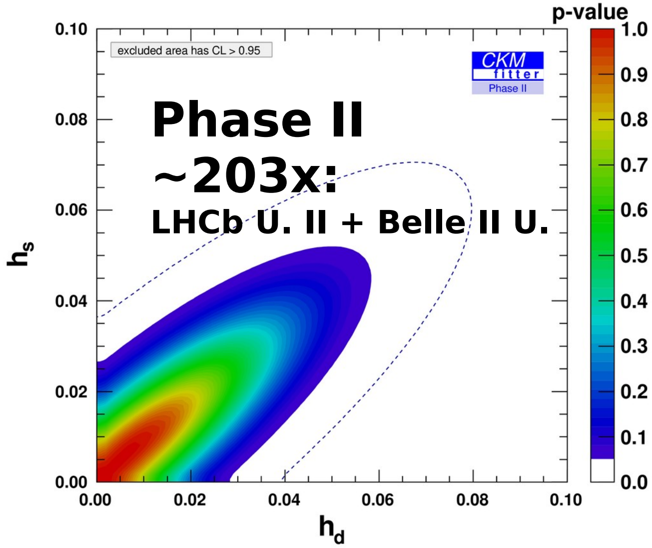
Future improvements

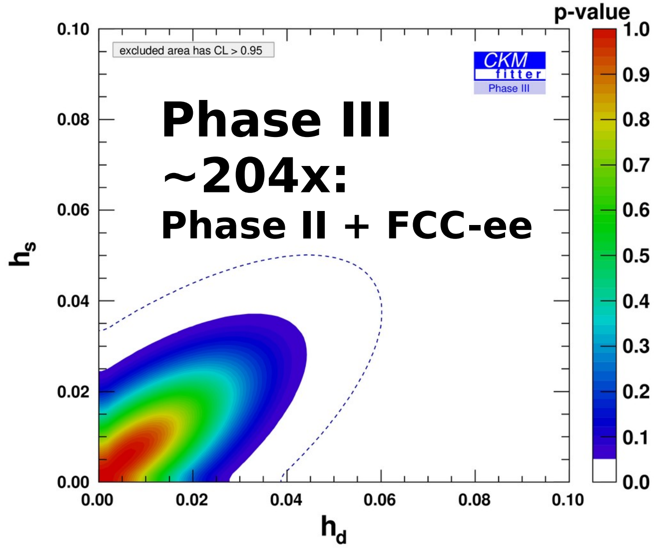


- SM reference: <u>shift the central values</u>
- Compared to Current, **improvement by factor >3 (5) at Phase I (II)**

Sensitivities	Summer 2019	Phase I	Phase II	Phase III
h_d	0.26	0.073	0.049	0.038
h_s	0.12	0.065	0.044	0.031







Future reach to NP in B meson mixing

$$\frac{C_{ij}^2}{\Lambda^2}(\bar{q}_{i,L}\gamma_\mu q_{j,L})^2,$$

$$h \simeq 1.5 \frac{|C_{ij}|^2}{|\lambda^t_{ij}|^2}\frac{(4\pi)^2}{G_F\Lambda^2} \simeq \frac{|C_{ij}|^2}{|\lambda^t_{ij}|^2}\left(\frac{4.5\ \text{TeV}}{\Lambda}\right)^2,$$

$$\sigma = \arg(C_{ij}\lambda^{t*}_{ij}),$$

- **In the absence of suppression mechanisms: NP scale >> TeV**
- **Possible flavour and loop suppressions: alleviate bounds on NP**

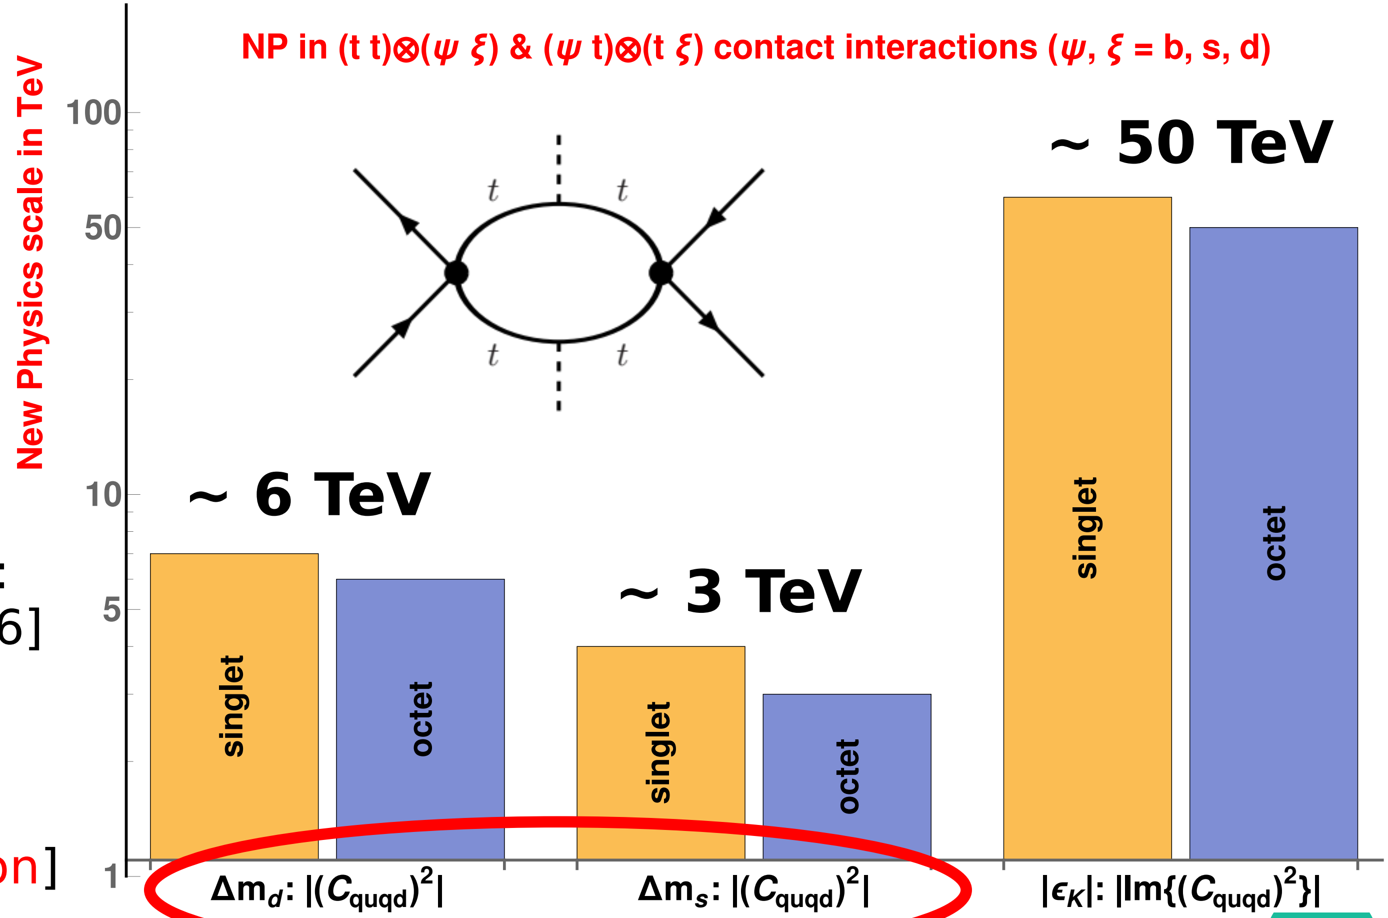
		Sensitivity for Summer 2019 [TeV]		Phase I Sensitivity [TeV]		Phase II Sensitivity [TeV]	
Couplings	NP loop order	B_d mixing	B_s mixing	B_d mixing	B_s mixing	B_d mixing	B_s mixing
$\lvert C_{ij}\rvert = \lvert V_{ti}V^*_{tj}\rvert$	Tree level	9	13	17	18	20	21
(CKM-like)	One loop	0.7	1.0	1.3	1.4	1.6	1.7
$\lvert C_{ij}\rvert = 1$	Tree level	1×10^3	3×10^2	2×10^3	4×10^2	2×10^3	5×10^2
(No hierarchy)	One loop	80	20	2×10^2	30	2×10^2	40

Sensitivity to SMEFT operators

|ΔF|=2 dim.-8: sensitivity to multi-TeV NP effects

- **|ΔF|=2 dim.-6 operators: talk by J. Aebischer**
- **(|ΔF|=1 dim.-6)² => |ΔF|=2 dim.-8 operators**

NP bag parameters: [ETM ’15, FNAL-MILC ’16]

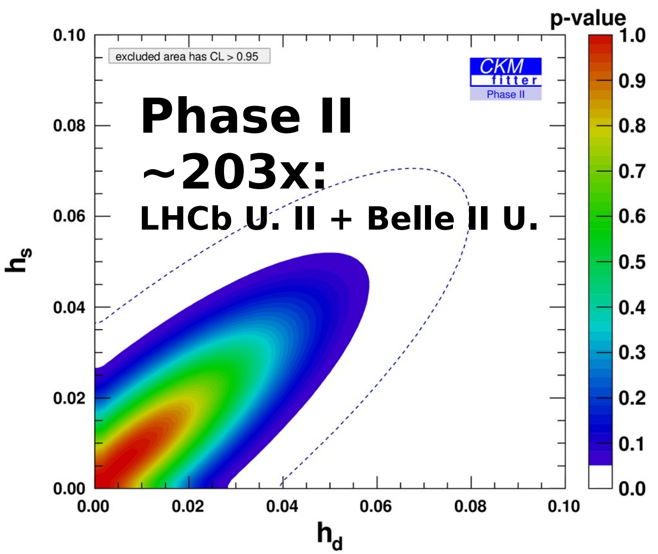


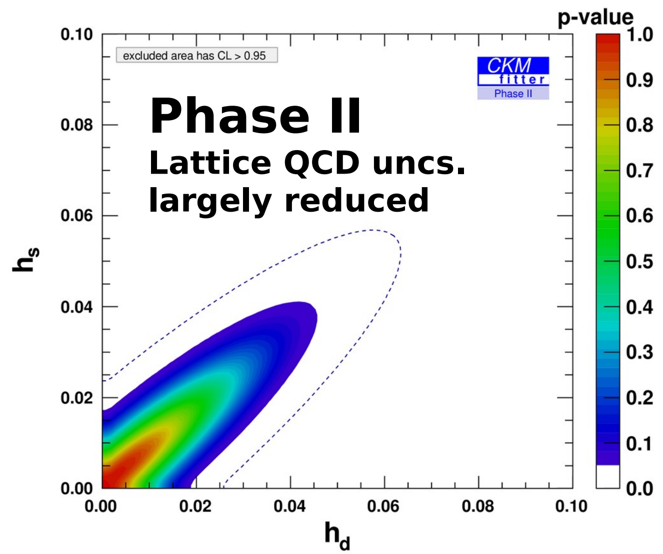
[LVS, work in preparation]

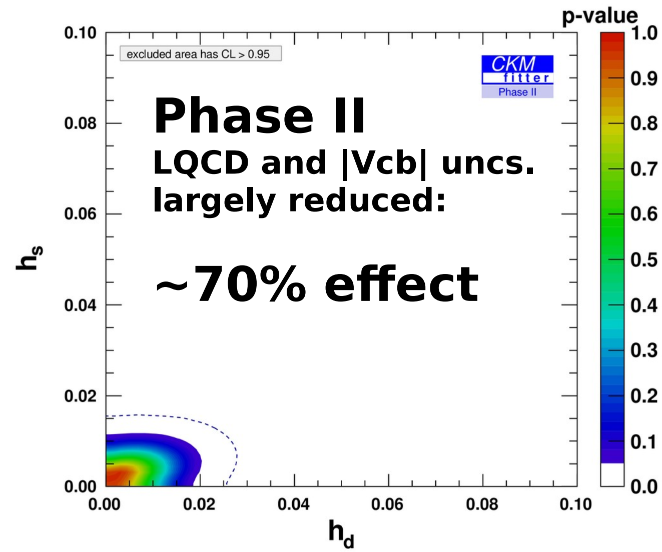
Bottlenecks

Necessary improvements beyond current expectations **for enhancing sensitivity to NP**:

- **Lattice QCD** (also short-distance QCD corrections)
- $|V_{cb}|$, overall normalization (Wolfenstein parameter A)
- **Individual impacts on h_d and h_s**: O(20-30)%

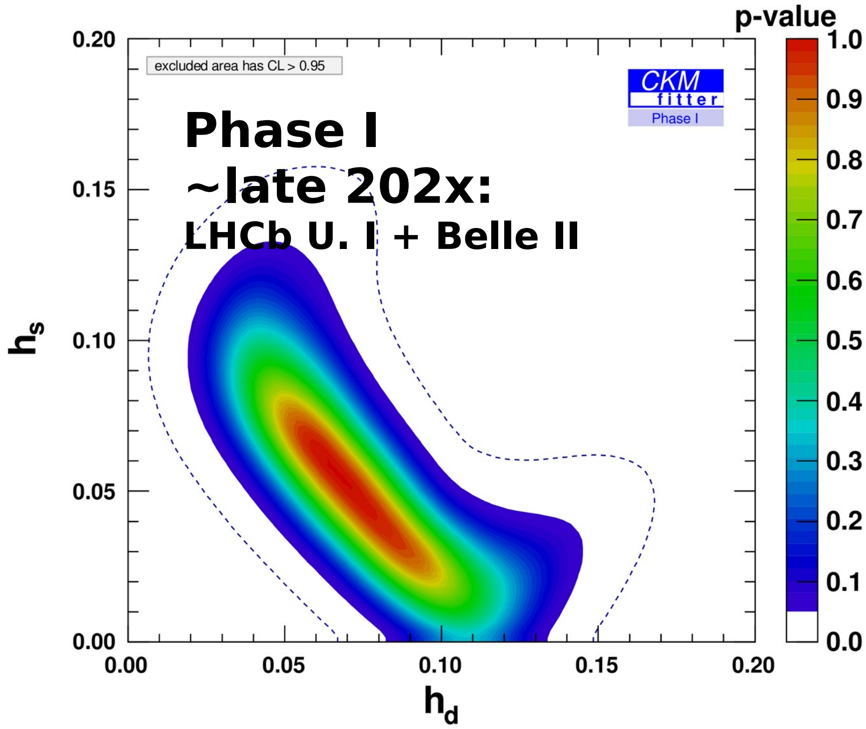


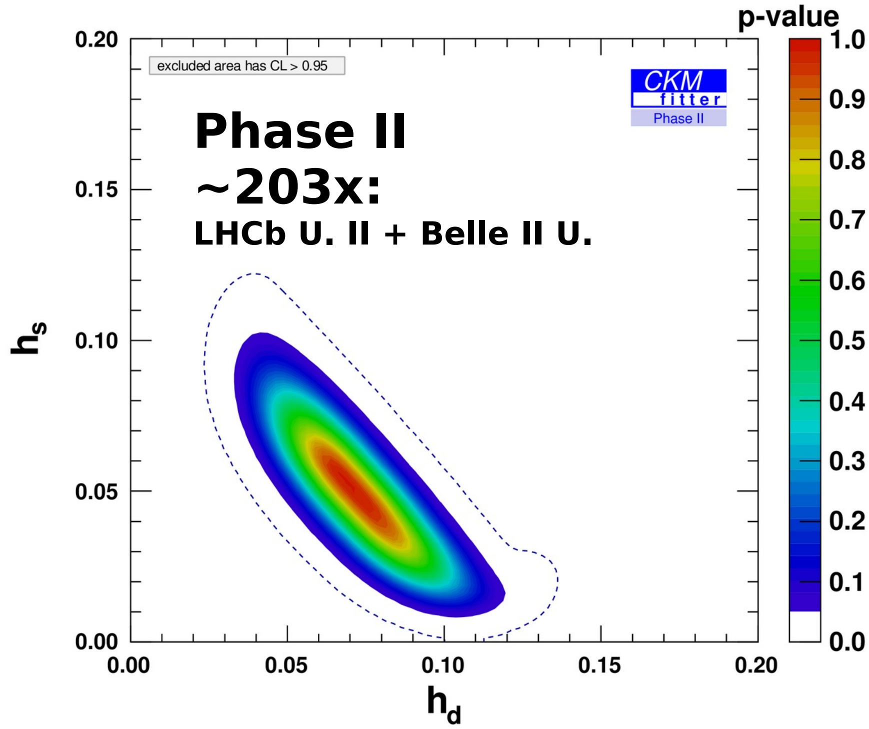




Discovery prospects

B meson mixing observables also provide potential discovery for NP





Conclusions

- **Flavour physics: crucial in shaping the SM, but also in looking for candidates of NP**
- **$|\Delta B|=2$: only one flavour aspect of future experimental and theoretical progress**
- **Allowed NP in B meson mixing still large: bounds will largely improve**
- **Identified future limitations:**

  LQCD and $|V_{cb}|$

Many thanks for your attention!

BACK UP!

Experimental quantities vs. theoretical ones

Observables considered in the fit that are modified by NP in $|\Delta B|=2$:

$$\Delta_q = |\Delta_q| e^{i2\Phi_q^{\rm NP}}$$

parameter	prediction in the presence of NP
Δm_q	$\|\Delta_q^{\rm NP}\| \times \Delta m_q^{\rm SM}$
2β	$2\beta^{\rm SM} + \Phi_d^{\rm NP}$
$2\beta_s$	$2\beta_s^{\rm SM} - \Phi_s^{\rm NP}$
2α	$2(\pi - \beta^{\rm SM} - \gamma) - \Phi_d^{\rm NP}$
$\Phi_{12,q} = {\rm Arg}[-\frac{M_{12,q}}{\Gamma_{12,q}}]$	$\Phi_{12,q}^{\rm SM} + \Phi_q^{\rm NP}$
A_{SL}^q	$\frac{\Gamma_{12,q}}{M_{12,q}^{\rm SM}} \times \frac{\sin(\Phi_{12,q}^{\rm SM}+\Phi_q^{\rm NP})}{\|\Delta_q^{\rm NP}\|}$
$\Delta\Gamma_q$	$2\|\Gamma_{12,q}\| \times \cos(\Phi_{12,q}^{\rm SM} + \Phi_q^{\rm NP})$

Different representation

$$\langle B_q | \mathcal{H}^{\rm SM+NP}_{\Delta B=2} | \bar{B}_q \rangle \equiv \langle B_q | \mathcal{H}^{\rm SM}_{\Delta B=2} | \bar{B}_q \rangle \times (\mathrm{Re}(\Delta_q) + i\,\mathrm{Im}(\Delta_q))$$

$$\mathrm{Re}(\Delta_q) + i\mathrm{Im}(\Delta_q) = r_q^2 e^{i2\theta_q} = 1 + h_q e^{i\sigma_q}$$
