

# 8 and 13 TeV Powheg predictions

Aleko Khukhunaishvili

University of Rochester

LHC EW precision subgroup meeting

April 30, 2020

# Setup

- Observable: Born level  $A_4(m, y)$
- (N)LO EW Powheg + NLO QCD generated with Powheg Z(\_ew) + Pythia8
- $\sin^2 \theta_{\text{eff}}^\ell : 0.23150(\pm 0.00050)$
- NNPDF31\_nnlo\_hessian\_pdfs
- 6 equal  $y_{\ell\ell}$  bins with width of 0.4
- 7  $m_{\ell\ell}$  bins: **52,66,76,86,96,106,116,150**
- muon and electron channels
- total of about 2.5 billion 8TeV and 5 billion 13 TeV events

# Configurations

- 18  $A_4(y, m)$  histograms
  - 8 and 13 TeV
  - $\sin^2 \theta_{\text{eff}}^\ell = 0.23150, 0.23100, 0.23200$
  - “ewkZnoew”, “nomZmod”, “ewkZnom”
- all 3 configs use  $\sin^2 \theta_{\text{eff}}^\ell = 0.23150$  default as input
  - **ewkZnoew**: “Z\_ew” program with  $no\_ew = 1$
  - **ewkZnom**: “Z\_ew” program with  $no\_ew = 0, ew\_ho = 0$
  - **nomZmod**: “Z” program with adjusted Z mass and width
- alternative  $\sin^2 \theta_{\text{eff}}^\ell$  predictions are done with reweighting
  - histograms will be included in

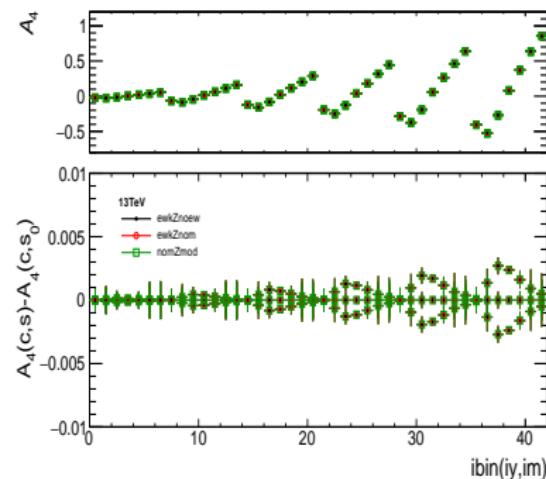

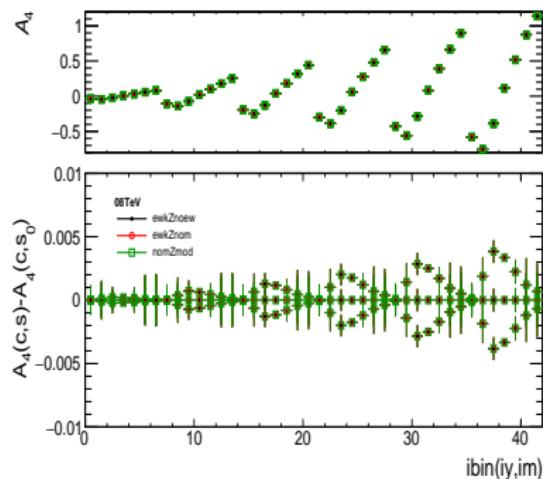

`/afs/cern.ch/user/a/akhukhun/public/LHCsw2PseudoData/aleko_sw2_v1.root`

# Predictions in bins of mass and rapidity

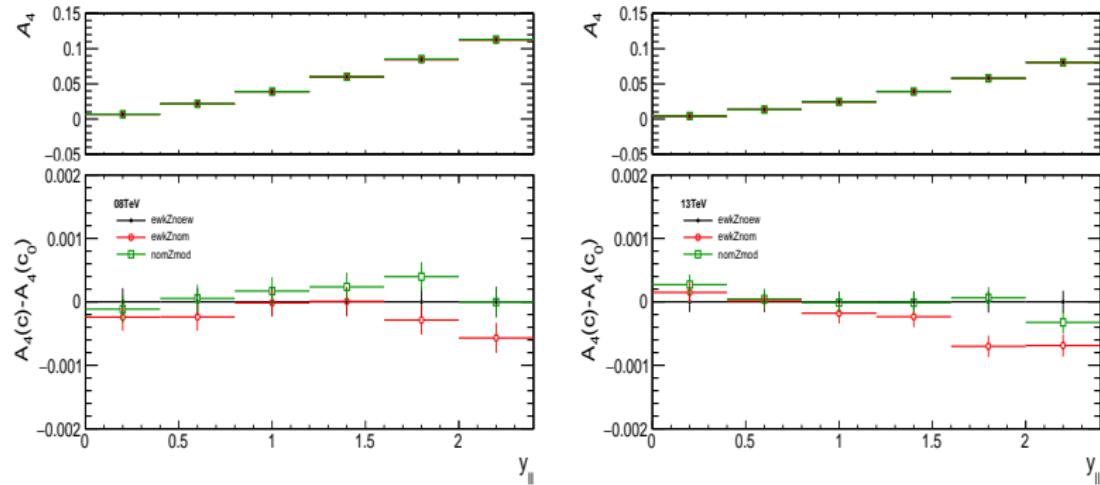

- variations are generated with reweighting

- changes seem identical for 3 setups

# Predictions in rapidity for Z peak bin

- central  $\sin^2 \theta_{\text{eff}}^\ell$  and Z peak bin predictions

- `ewkZnom` seems slightly lower on average
- need to understand (if there are significant) differences between 8 and 13 TeV
- next: need to quantify in terms of resulting fit  $\sin^2 \theta_{\text{eff}}^\ell$
