NA61/SHINE 2D scan

Two-dimensional scan in collision energy and mass of colliding nuclei.

Diagram of high-energy nuclear collisions

Layout of the NA61/SHINE experimental setup

Coverage of the full forward hemisphere, down to $p_T = 0$.

Centrality selection

Centrality selection is based on the projectile spectator energy E_F measured by the Projectile Spectator Detector (PSD).
For Xe+La 20% of the most central events are selected as events with $E_F < 6.8$ TeV (total beam energy: 19.4 TeV).

h^- method for π^-

h^- – all negatively charged hadrons ($\approx 90\% \pi^- + K^- + \bar{p} + \dots$)

π^- MC
generated

\times

$=$

π^- corrected spectrum

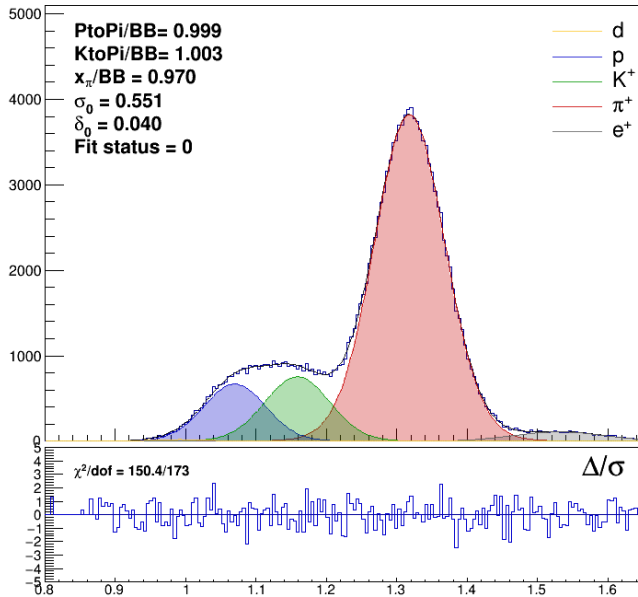

Raw h^- spectrum, MC generated π^- and selected h^- spectra,
corrected spectrum of π^- using h^- method for Xe+La at 150A GeV/c.

dE/dx vs p after all cuts

Bethe: $\left\langle -\frac{dE}{dx} \right\rangle = \frac{A}{\beta^2} [\ln B\beta^2\gamma^2 - 2\beta^2 - \delta(\beta\gamma)], (0.1 \leq \beta\gamma \leq 1000)$

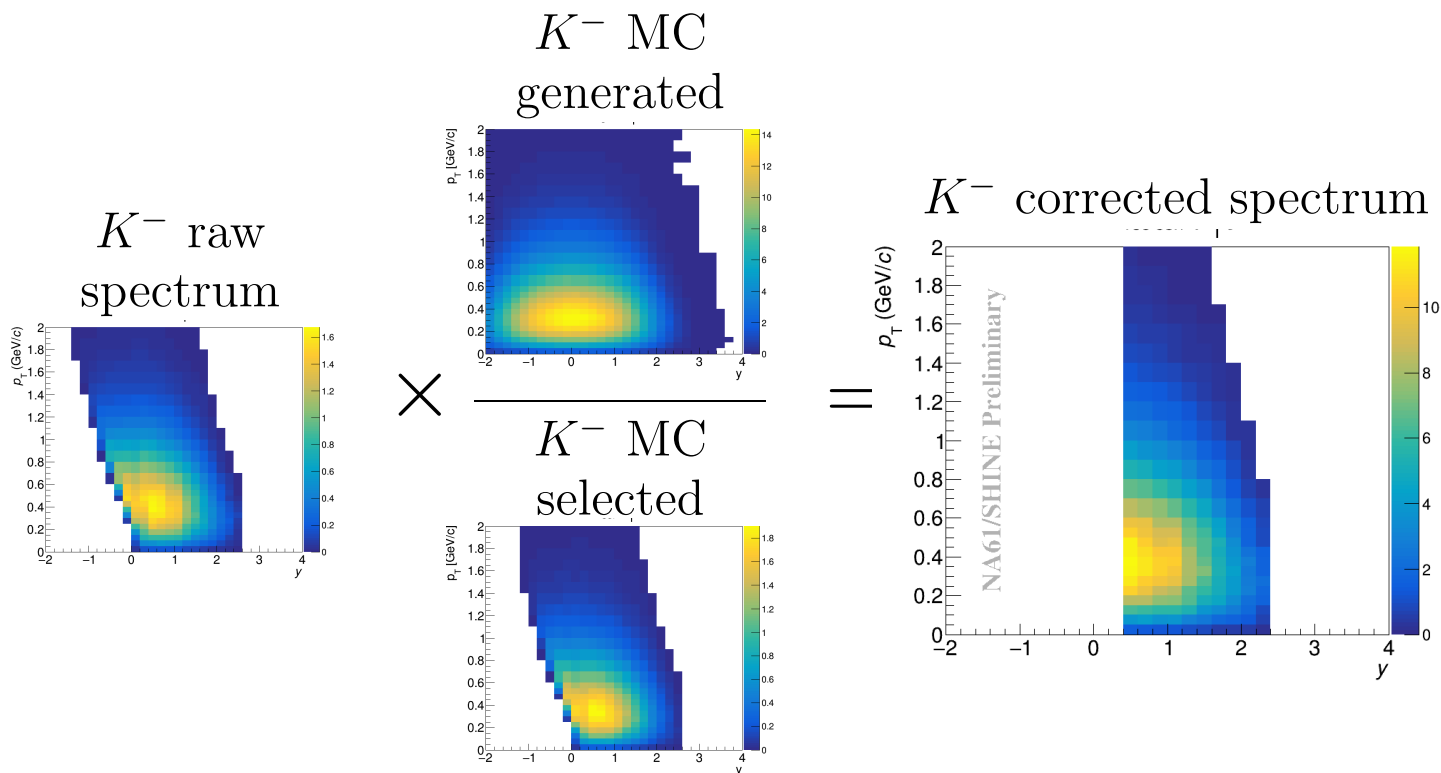

Fitting

Fit with sum of asymmetric Gaussians for $p, \bar{p}, K^{\pm}, \pi^{\pm}, e^{\pm}, d$:

$$f(x) = \sum_{i=p,K,\pi,e,d} N_i \frac{1}{\sum_l n_l} \sum_l \frac{n_l}{\sqrt{2\pi}\sigma_{i,l}} \exp \left[-\frac{1}{2} \left(\frac{x - x'_i}{(1 \pm \delta)\sigma_{i,l}} \right)^2 \right]$$

MC corrections for dE/dx method for K^-

Raw K^- spectrum, MC generated and selected K^- spectra, corrected spectrum of K^- using dE/dx method for Xe+La at 150A GeV/c.

Corrected $d^2n/dydp_T$ spectra of K^+ , K^- and π^-

K^\pm and π^- p_T spectra at $y = 0.4 - 0.6$

p_T spectra are presented for $y = 0.4 - 0.6$ – closest to midrapidity measured point for K^\pm .

dn/dy spectrum of π^-

Assigned systematic uncertainty is 5% of the bin value.

For all spectra open points are reflected measured data points.

Fit with sum of two symmetric Gaussians:

$$\frac{dn}{dy} = \frac{A}{\sigma\sqrt{2\pi}} \left(\exp \left[-\frac{(y - y_0)^2}{2\sigma^2} \right] + \exp \left[-\frac{(y + y_0)^2}{2\sigma^2} \right] \right).$$

K^+/π^+ and K^-/π^- at $y \approx 0$

$\langle K^+ \rangle / \langle \pi^+ \rangle$ and $\langle K^- \rangle / \langle \pi^- \rangle$

Inverse slope parameter T for K^+ and K^-

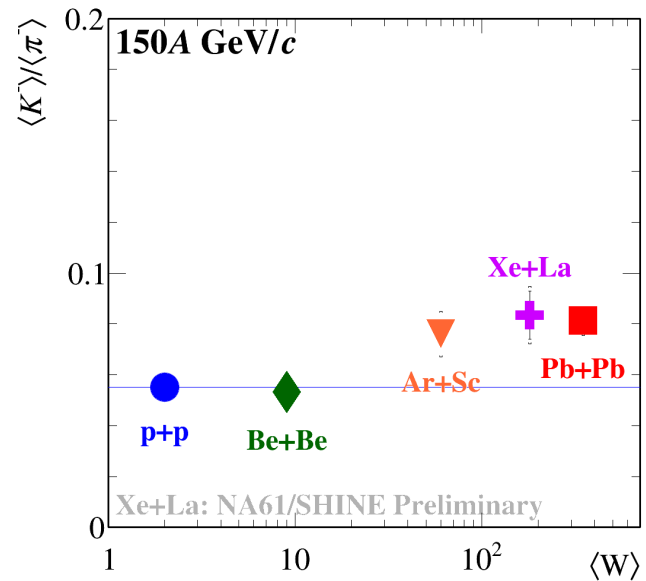

System size dependence of K^+/π^+ at $y \approx 0$

Comparison with models:

Statistical uncertainties are shown as bars and systematic with square braces.

System size dependence of $\langle K^+ \rangle / \langle \pi^+ \rangle$ and $\langle K^- \rangle / \langle \pi^- \rangle$

Statistical uncertainties are shown as bars and systematic with square braces.

System size dependence of T for K^+ and K^-

Statistical uncertainties are shown as bars and systematic with square braces.

Summary

- First results on spectra and total yields of π^- , K^+ and K^- produced in central Xe+La collisions at beam momentum $150A$ GeV/ c are presented.
- K^+/π^+ and K^-/π^- ratios at $y \approx 0$ and $\langle K^+ \rangle / \langle \pi^+ \rangle$ and $\langle K^- \rangle / \langle \pi^- \rangle$ for Xe+La are close to the corresponding ratios for Pb+Pb.
- The inverse slope parameter of the p_T spectra of K^\pm at midrapidity for Xe+La is close to Pb+Pb.

Outlook

- New results at lower SPS beam momenta ($13A-75A$ GeV/ c) will be released soon and they will answer the question whether horn is visible in Xe+La.

BACKUP SLIDES

Distribution of strangeness between hadrons

– sensitive to strangeness content only

– sensitive to strangeness content and baryon density

How to measure strangeness

$$2\langle N_{s\bar{s}} \rangle = \langle \Lambda + \bar{\Lambda} \rangle + \langle K^+ + K^- + K^0 + \bar{K}^0 \rangle + \dots$$

$$2\langle N_{s\bar{s}} \rangle \approx \langle \Lambda \rangle + \langle K^+ + K^- + K^0 + \bar{K}^0 \rangle,$$

$$\langle N_{s\bar{s}} \rangle \approx \langle \Lambda \rangle + \langle K^- + \bar{K}^0 \rangle \approx \langle K^+ + K^0 \rangle \approx 2\langle K^+ \rangle.$$

How to measure entropy

Entropy $\sim \langle \pi \rangle$

$$\langle \pi \rangle = \langle \pi^+ + \pi^0 + \pi^- \rangle \approx 3\langle \pi^+ \rangle$$

Experimental measure of strangeness to entropy ratio

$$\frac{\text{strangeness}}{\text{entropy}} \sim \frac{\langle N_{s\bar{s}} \rangle}{\langle \pi \rangle} \approx \frac{2\langle K^+ \rangle}{3\langle \pi^+ \rangle}$$
