New measurements in fixed-target collisions at LHCb

Thursday 7 April 2022 15:20 (20 minutes)

The LHCb spectrometer has the unique capability to function as a fixed-target experiment by injecting gas into the LHC beampipe while proton or ion beams are circulating. The resulting beam+gas collisions cover an unexplored energy range that is above previous fixed-target experiments, but below the top RHIC energy for AA collisions. Here we present new results on antiproton and charm production from pHe, pNe, and PbNe fixed-target collisions at LHCb. Comparisons with existing measurements and various theoretical models of particle production and transport through the nucleus will be discussed.
