

## VERTEX 2020

Latest developments and results of  
radiation tolerance CMOS sensors  
with small collection electrodes

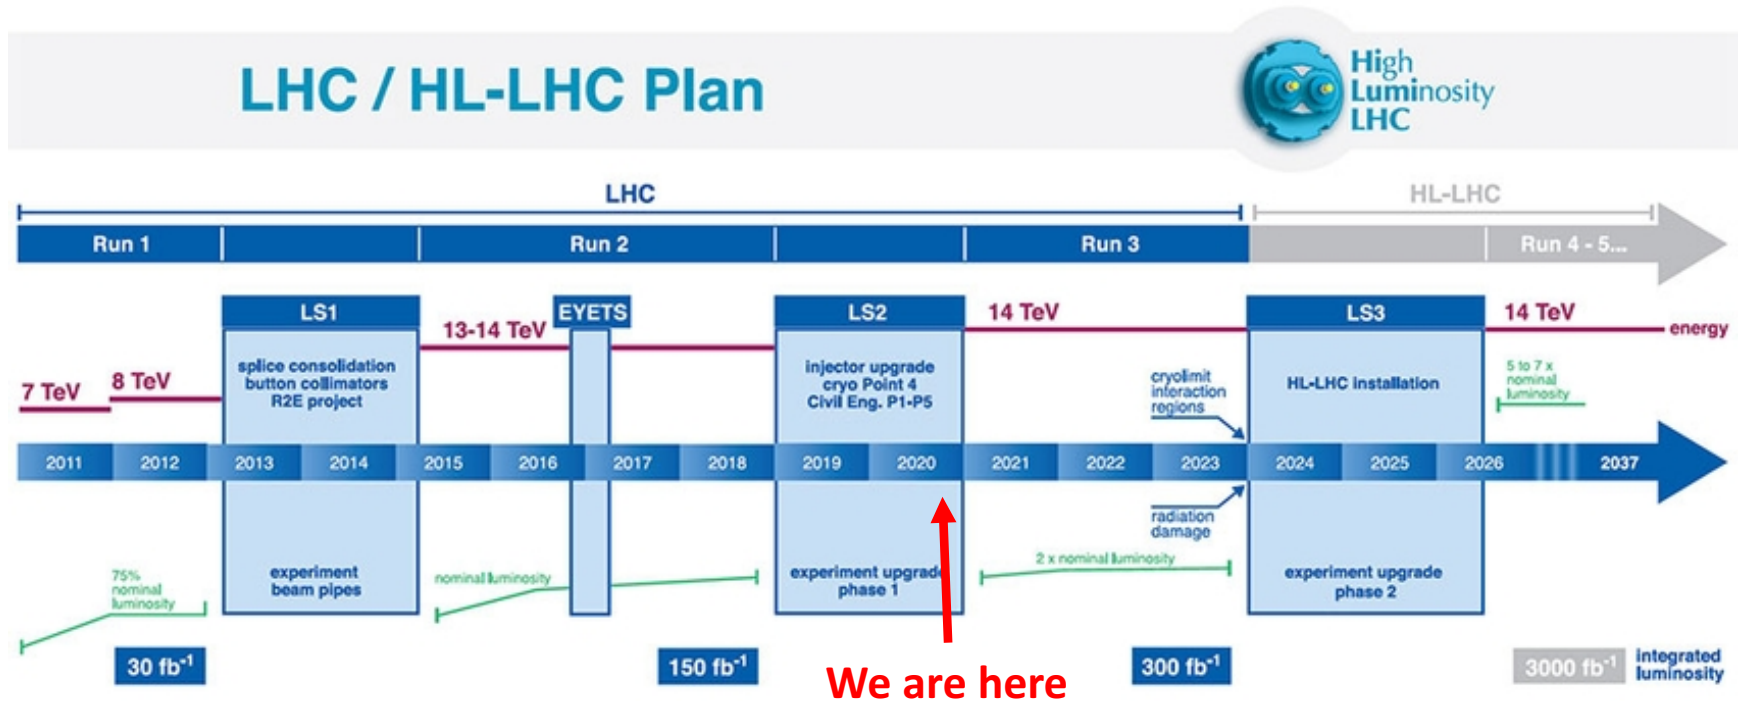

VNIVERSITAT  
ID VALÈNCIA

**Ignacio Asensi** on behalf of Phil Allport, Tobias Bisanz, Daniela Bortoletto, Valerio Dao, Dominik Dobrijevic, Mateusz Dyndal, Leyre Flores, Patrick Freeman, Andrea Gabrielli, Laura Gonella, Maria Mironova, Kaan Oyulmaz, Heinz Pernegger, Petra Riedler, Jose Torres, Abhishek Sharma, Carlos Solans, Walter Snoeys, Steven Worm...

# LHC Introduction

- LHC is going through a series of upgrades
- HL-LHC will deliver 3000 fb<sup>-1</sup> after Phase II
- Luminosities from 7.5 to 30 x 10<sup>34</sup> cm<sup>-2</sup> s<sup>-1</sup>
- And from 200 up to 1000 interactions per bunch crossing
- These upgrades present many challenges for electronics and radiation hardness
- Monolithic pixel detectors could address these challenges for the LHC and beyond

ATLAS Inner detector

CMS pixel detector

- Higher rates of  $\sim 2\text{MHz/mm}^2$  require smaller sensors to separate individual particles
- Pixel detectors have to overcome high radiation requirements of  **$1\text{e}15$  to  $2\text{e}15$   $n_{\text{eq}}/\text{cm}^2$  NIEL**
- Pixel detectors can overcome fast timing of  **$25\text{ns}$**  bunch crossing
- Interesting for studies beyond HL-LHC
  - FCC recommended by 2020 Update of the European Strategy for Particle Physics
  - Monolithic pixel sensors present a high potential for HEP with low power consumption ( **$<0.5\text{W/cm}^2$** ) and industrial-like production

# Depleted Monolithic Active Pixel Sensors

## RnD designs for Depleted Monolithic Active Pixel Sensors (MAPS) on the search for best performance and radiation hardness

- **Large electrode**
  - Large capacitance ( $\sim 100$  fF)
  - Electronics in collection well
  - Higher noise (due to larger sensor capacitance)
  - Potential crosstalk between digital and analog sections
- **Small electrode**
  - Low capacitance ( $\sim 5$  fF)
  - Electronics separated from collection well
  - Lower noise (small capacitance for high SNR)
  - Separate digital and analog electronics
  - Need process modification for radiation hardness
- **Buried electrode**
  - Separated layers for electronics and sensor
  - To overcome radiation ionization charge trapped in the non depleted part

Large electrode

Small electrode

Buried electrode

## To be compared with Hybrid sensors

- More expensive and complex
- Two chips: Sensor and a read-out chips
- Large electrodes and large capacitance
- Buried electrodes

Two chips

## Processes already used in Alice (ALPIDE)

### Standard

- Small collection electrode ( $\sim 3 \mu\text{m}^2$ ) with high-resistivity Epi layer
- Small input capacitance ( $< 3 \text{ fF}$ )
- Small depletion depth ( $\sim 20 \mu\text{m}$ )
- High signal to noise ratio ( $\sim 20$ )

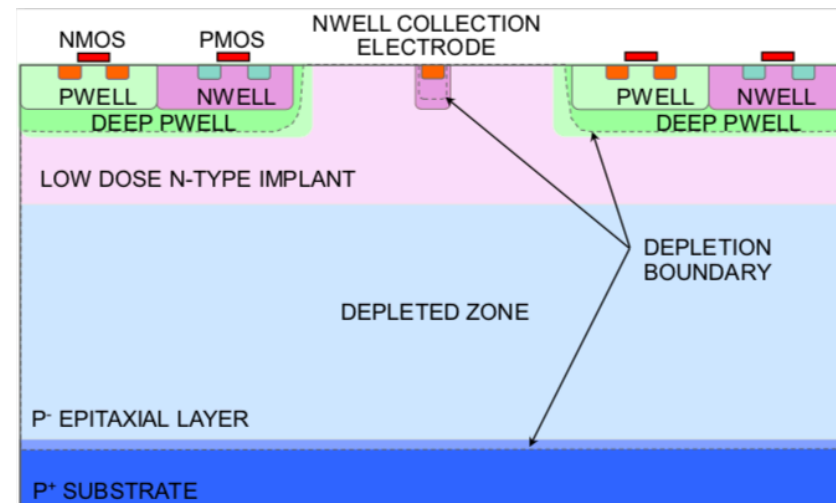

### Standard process

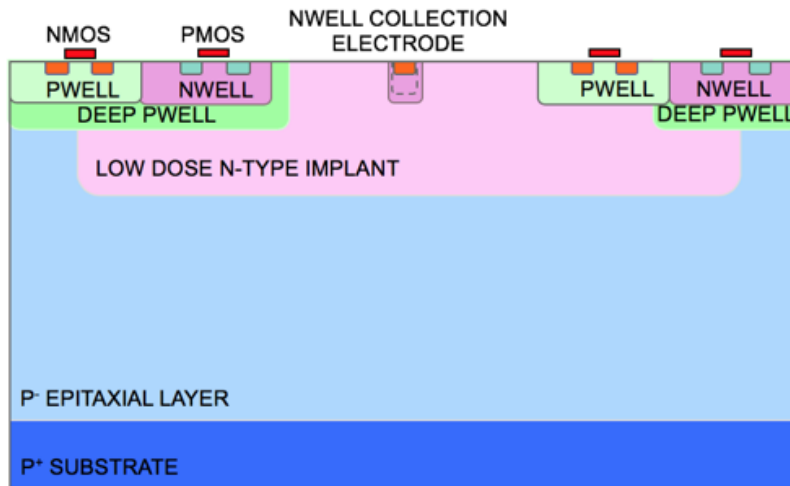

### Modified with continuous n-layer

- Extra n-type layer to improve depletion under the deep p-well
- Overcome diffusion which makes collection slower

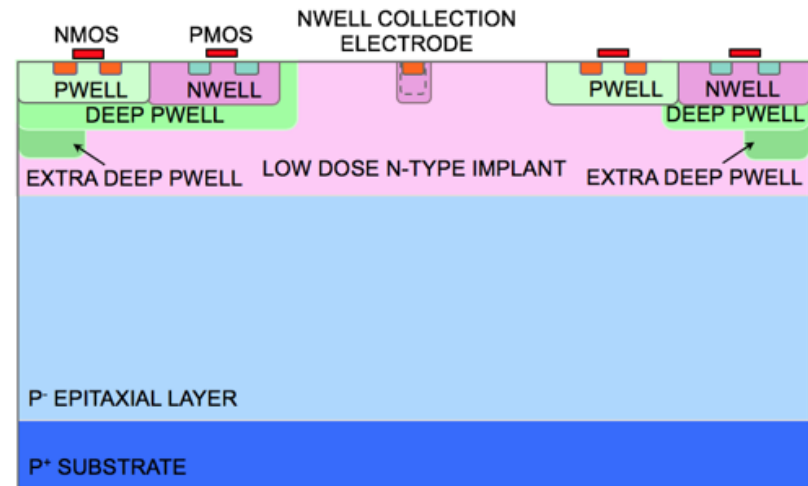

### Continuous N-layer

## Gap in the n-layer

## Extra deep p-well

## Process **modifications** for radiation hardness

- **Continuous n-layer (Cont.):** Full lateral depletion. (See prev. slide)
- **Gap in the n-layer (n-gap):** Modification of the mask
- **Extra deep p-well implant (EDPW):** Additional mask

More details and description of the process modification and summary of results in:

[M. Dyndal, JINST 15 \(2020\) P02005](#)

Jun 2018

**MALTA1 & MLVL**

## Sensor modifications

- Continuous n-layer
- MLVLC

## Chip

- Large demonstrator 2x2
- Asynchronous readout
- Slowcontrol issues

From  
Jan 2019

**Mini-MALTA  
And**

- Cascoded FE
- Process modification

- Small demonstrator 1.7x0.5
- Serial output

**Mini-MALTA ATTRACT**

- Full efficiency after  $1e15 \text{ n/cm}^2$

From  
Aug 2019

**MALTA C  
and  
MALTA Cz**

- 3 types of process modification

- Large demonstrator 2x2
- Slow control improvements
- Enlarged cluster size and improved time resolution

Oct 2020

**MALTA 2**

- Mini-MALTA FE
- 3 types of process modification
- Different doping levels

- Smaller matrix 2x1
- New Slowcontrol
- Baseline for CERN EP R&D WP 1.2

# TJ MALTA sensor

- Matrix **512 x 512** pixels of **36.4 x 36.4  $\mu\text{m}^2$**  size
- **8 sectors** with different pixel flavors
- Fully clock-less matrix architecture
- **Asynchronous readout** architecture for high hit rates and fast signal response. Parallel read-out bus 37bit.
- 10 mW/cm<sup>2</sup> digital power
- Small collection electrode of 2-3  $\mu\text{m}$  to achieve minimal capacitance <3fF
- 3.4 - 4  $\mu\text{m}$  spacing to electronics
- **Very low power consumption:**
  - ❑ 1  $\mu\text{W}$ /pixel analog power
  - ❑ 70 mW/cm<sup>2</sup> analog power

# Possible MALTA application

## Using MALTA to trigger telescope

- Xilinx Virtex-7 FPGA VC707 for readout
- Trigger from MALTA planes as combination reference signals and compatible with AIDA telescopes

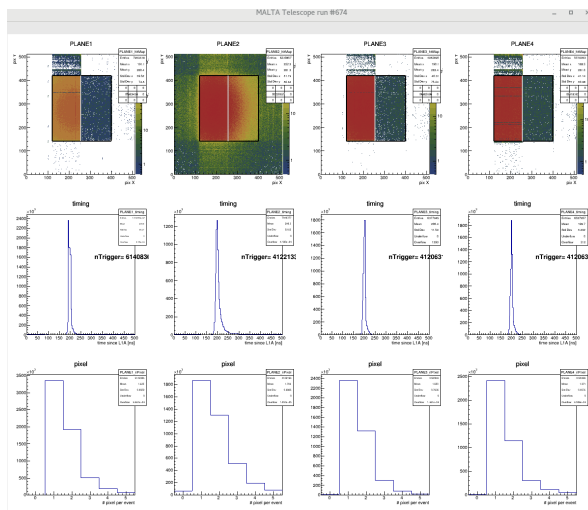

## Telescope details:

- 4 to 6 MALTA planes (100  $\mu\text{m}$  thick, 36  $\mu\text{m}$  pitch size)
- Achieving 14  $\mu\text{m}$  track-hit resolution using only 3 tracking planes and General Broken Line (GBL) algorithm in Proteus with 3 e<sup>-</sup> GeV beam in DESY
- Carry-on telescope during LS2 with linear stage for alignment
- Based on custom multi threaded application
- USB based PSU control

DESY

Setup with DUT cold down to -20°C by Si-oil system

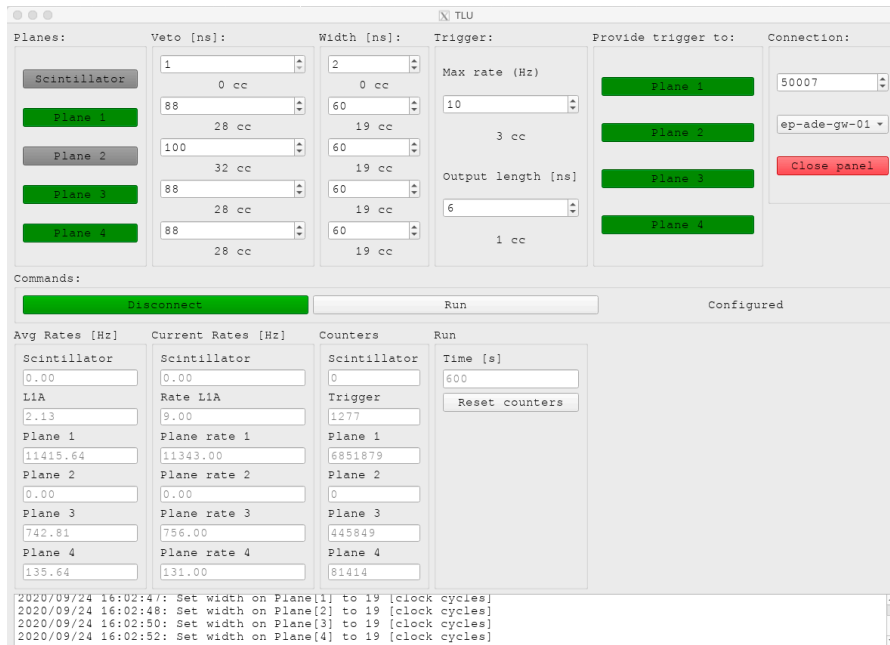

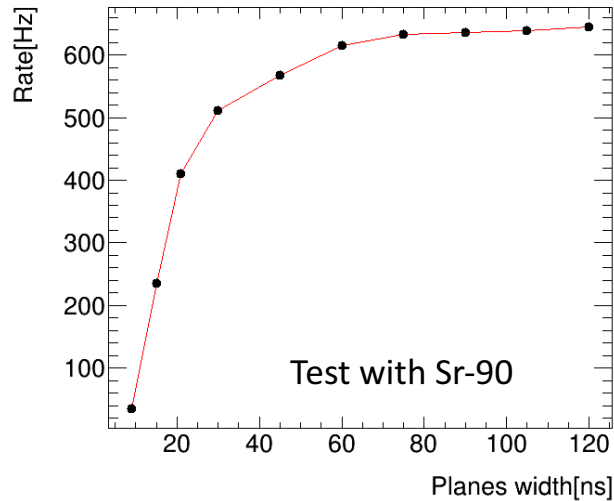

Improved DAQ interface

# MALTA telescope TLU

## Custom Kintex based Trigger Logic Unit (TLU)

- VHDL FW, CMS IPbus and C++/python driven
- Veto, signals width and combination logic configurable from GUI
- Support for scintillator and up to 6 planes

TLU GUI operating and monitoring telescope

# TJ Mini-MALTA sensor

## Aim to improve MALTA efficiency loss after irradiation

- Matrix **64x16** pixel with **36.4 $\mu\text{m}$**  pitch
- 8 sectors** with different analogue front-end design
- Asynchronous read-out
- Improved **SlowControl** implementation
- Single serial data stream: 40Mbps or 1.2 Gpbs with 8b10b encoding
- Implemented gap in n- layer and extra deep p-well process modifications
- Periphery data synchronization using a custom RAM memory
- Larger capacitors** to reduce noise

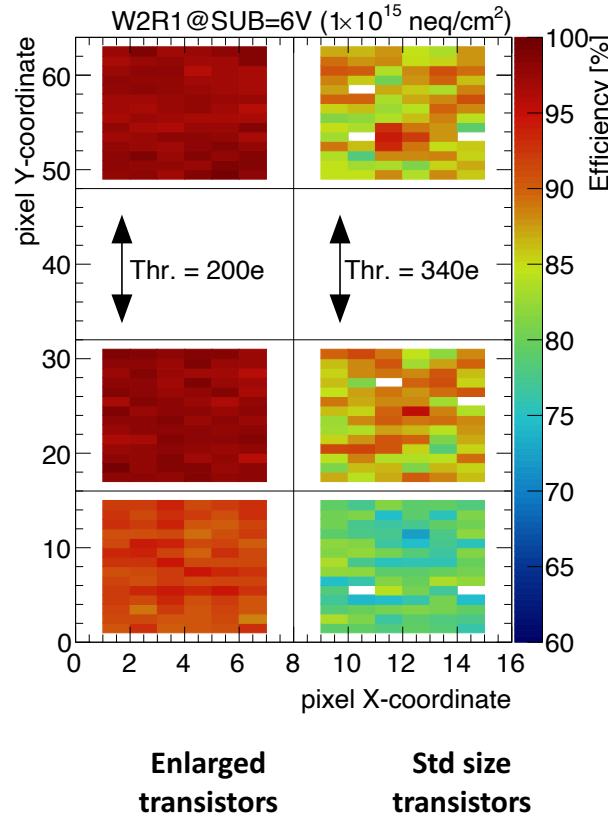

# Mini-MALTA efficiency map

## Non irradiated

## Irradiated\*

- Full efficiency after irradiation at 200 e-threshold at 6V bias on sectors with enlarged transistors
- Due to improved charge collection in the pixel corners with respect to previous design (MALTA 1)
- Also observed with focused x-ray beam at Diamond Light Source (next slide)

\* Irradiated to  $1e15$  n/cm<sup>2</sup>, and measured with 2 GeV electron beam at ELSA, with 6 V bias voltage.

- **Photon pixel response as function of dose**
  - Reduction of pixel response in continuous n-layer of 10%
  - Almost no reduction on extra deep p-well and n-gap

W2R11 Un-irradiated

W2R1 Irradiated\*

[M. Mironova, NIM A 956 \(2020\) 163381](#)

\* Neutron-irradiated to  $1e15 \text{ n/cm}^2$

# Mini-MALTA efficiency vs threshold

- Efficiency above 97% sensor modification with enlarged transitions
- Higher efficiency for enlarged transistors
- Efficiency above 90% after  $2 \times 10^{15} \text{ n}_{\text{eq}}/\text{cm}^2$  irradiation (see backup slide)

Efficiency versus threshold for two different Mini-MALTA samples, neutron irradiated to  $1 \times 10^{15} \text{ n}_{\text{eq}}/\text{cm}^2$ , and measured with 2 GeV electron beam at ELSA, with 6 V bias voltage

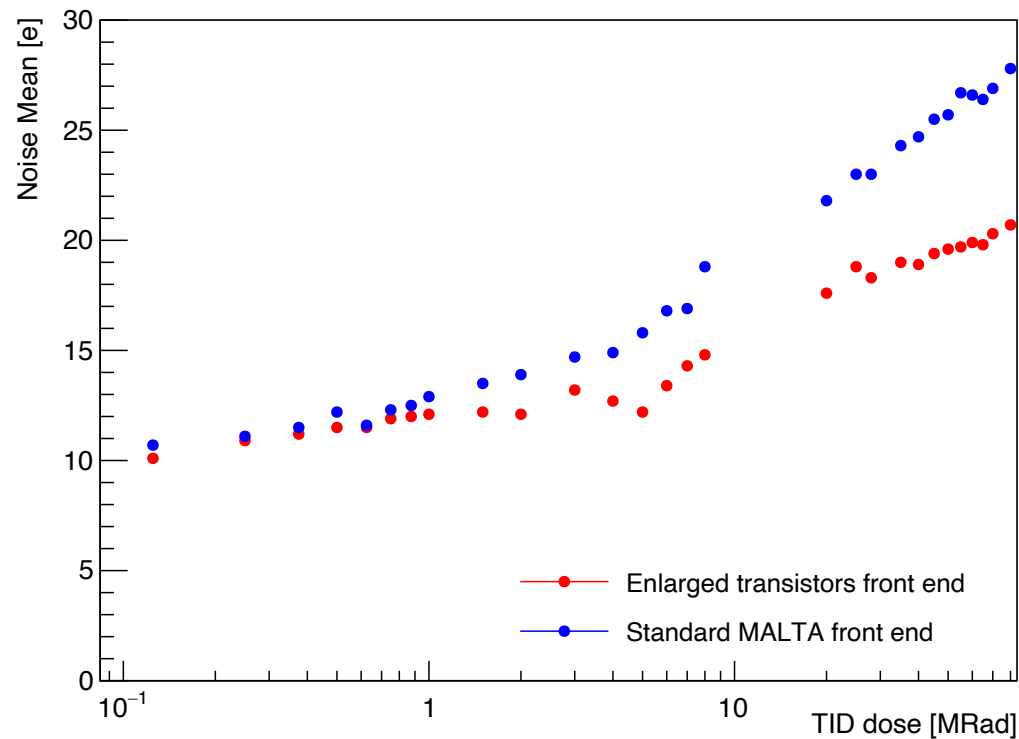

# Mini-MALTA - Noise after 100Mrad

## Mini-MALTA x-ray irradiated to a TID 100 Mrad Fe fluorescence

X-ray irradiations at Glasgow

Noise mean vs TID

- Noise increase  $10e^-$  to  $20e^-$  during irradiation on enlarged transistors
- $10e^-$  to  $30e^-$  on standard front-end

## Mini-MALTA $\gamma$ -irradiated to a TID 100 Mrad Fe fluorescence

X-ray irradiations at Glasgow

Amplitude of FE target as a function of TID

- Analog performance measured during irradiation
- Higher gain for enlarged transistors
- Unchanged after dose but with slight increase and then stabilization

## Processed with high resistivity Cz substrate material

- Larger depletion voltage and signal
- Higher radiation hardness
- **High operation voltage** up to 50V
  - High depletion depth

# MALTA CZ - Efficiency

- Radiation hardness of full size MALTA with Cz
- From 98.5 (un-irradiated) to 95.4 % efficiency after  $2 \times 10^{15} \text{ n/cm}^2$

Irradiated at DESY with 4 GeV electron beam

**MALTA Cz  
unirradiated**

**$\epsilon = 98.5\%$**

Sector 2,  $\langle \text{eff} \rangle = 98.5 \pm 0.0 \%$

**MALTA Cz n-gap  
 $1 \times 10^{15} \text{ n}_{\text{eq}}/\text{cm}^2$**

**$\epsilon = 97.0\%$**

Sector 2,  $\langle \text{eff} \rangle = 97.0 \pm 0.0 \%$

**MALTA Cz n-gap  
 $2 \times 10^{15} \text{ n}_{\text{eq}}/\text{cm}^2$**

**$\epsilon = 95.4\%$**

Sector 2,  $\langle \text{eff} \rangle = 95.4 \pm 0.0 \%$

[Check Hiroshima Presentation H.Pernegger HSTD12](#)

# Cluster size - Epi vs Cz std and n-gap

W7R4 Epi std, SUB=-12V  
Cluster size 1.2

Epi

W7R12 Cz std, SUB=-12V  
Cluster size 1.8

Cz std

W9R11 Cz n-gap, SUB=-12V  
Cluster size 1.4

N-gap

## Before irradiation

- Cz has higher cluster size (1.8)
- And more charge collection sharing
- N-gap modification has worse performance

# Cluster size - Epi vs Cz std and n-gap

W7R4 Epi std, SUB=-12V  
Cluster size 1.2

W7R1 Cz std, SUB=-50V  
Cluster size 1.2

W9R0 Cz n-gap, SUB=-50V  
Cluster size 1.4

## Cluster size after irradiation at -50V

- 1x10<sup>15</sup> MeV n<sub>eq</sub>/cm<sup>2</sup> at DESY with 3 GeV electron beam
- Cz standard** more affected by irradiation : From 1.8 to 1.2
- Cz n-gap** modification less affected: From 1.4 to 1.2

## Sr-90 measurements in the lab

IDB: Threshold for the discriminator

ITHR: Pulse duration of the amplifier output

### Cluster size

- We observe a smooth increase when increasing the voltage

### Efficiency

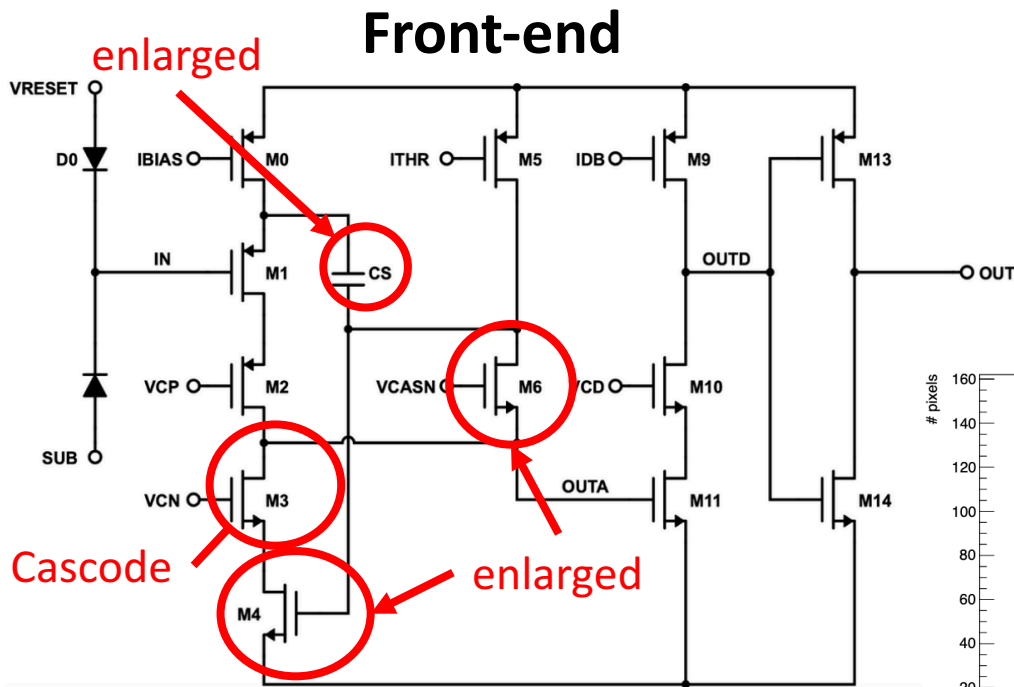

- Large discontinuities observed at 8V to ~12V and slighter over 30V

**\* Note at 30V**

Power supply replacement and higher room temperature

# Mini-MALTA ATTRACT

standard  
enlarged

Gain: 1.78/0.26

Gain: 2.72/0.34

Lower thresholds

- All sectors have cascode front-end (M3) and enlarged transistors
- Sectors 0 to 3 have higher gain (CS, M4, M6)
- Sectors 0 and 4 are 1.2 um EDPW
- Sectors 1 and 5 are 2 um EDPW
- Sectors 2 and 6 are standard n-layer
- Sectors 3 and 7 are NGAP

W2MOD - Mean value

W2MOD - RMS Value

## Mini-MALTA ATTRACT with full cascoded front-end

- Preliminary results
- Improvements in Front-end control and threshold
- Cascoded FE allows to reach thresholds below 100e
- Also more consistent values between enlarged and standard transistors

PWELL = -6V

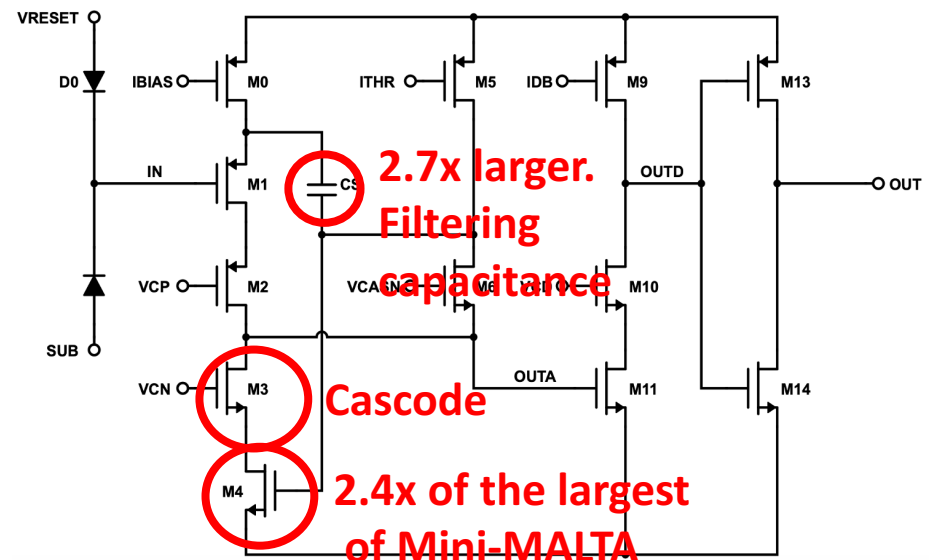

- **Submission on mid October 2020**
- 20.2x10.1mm sensor. Almost half size of MALTA
- Matrix of 224x512 pixels of 36.4  $\mu\text{m}$  size
- New sensor with gain optimized to improve time resolution
- 4322 bit shift register as new Slow Control
- Enlarged transistors from Mini-MALTA
- Half sensor cascode front-end for higher gain and reduced RTS noise
- **Applying all the knowledge we learnt from MALTA C, Mini-MALTA, ATTRACT and Czochralski**

MALTA 2 two front-end flavors

Analog front end modifications

# Conclusions

- MALTA monolithic CMOS sensor continues improving performance with Mini-MALTA and Cz versions
- Modifications n-gap and extra deep p-well show full efficiency after 100Mrad and  $10^{15}n_{eq}/cm^2$
- Many improvements applied to the design of MALTA 2 which will be submitted mid October

# Acknowledgements

- Part of the measurements leading to these results have been performed at the Test Beam Facility at DESY Hamburg (Germany), a member of the Helmholtz Association (HGF).
- Part of the measurements leading to these results have been performed at the E3 beam-line at the electron accelerator ELSA operated by the university of Bonn in Nordrhein-Westfalen, Germany.
- This project has received funding from the European Union's Horizon 2020 Research and Innovation program under Grant Agreement no. 654168.(IJS, Ljubljana, Slovenia)
- Dr. Ben Phoenix, Prof. David Parker and the operators at the MC40 cyclotron in Birmingham (UK).

# Backup

# Hybrid vs Monolithic sensors

## Hybrid

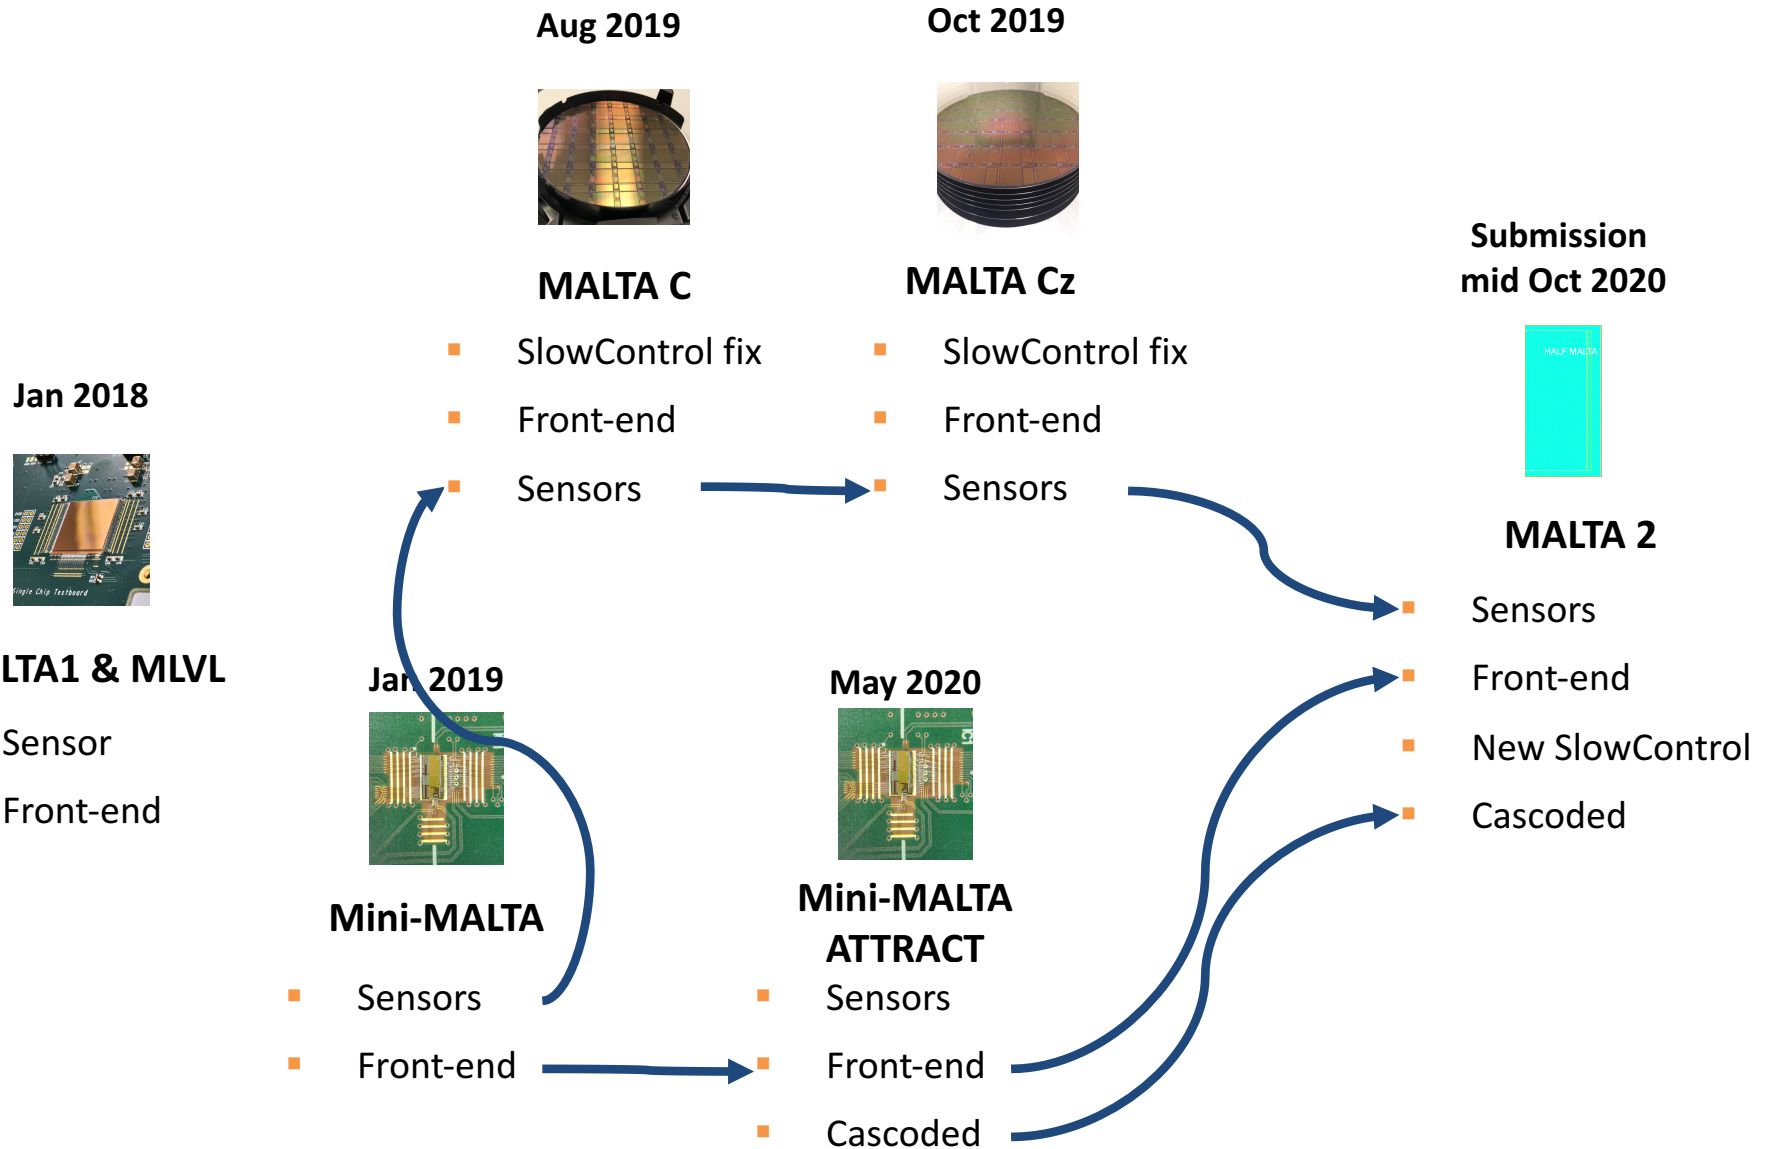

- Popular in current LHC detectors
- Proven radiation hardness
- Dedicated front-end electronics bonded to the sensor
- Thicker modules
- Complex and costly assembly due to fine-pitch bump bonding

## Monolithic

- Radiation hardness in research
- Electronics and sensor integrated on a single chip
- Low cost per wafer
- Thinner modules
- Substantial cost reduction and reduced module assembly time

# Modifications time line overview

# MALTA telescope tracking

Using General Broken Lines (GBL) algorithm to mitigate multiple scattering effects

- Tracking resolution
  - Distance from the cluster barycenter to the track intercept using a clusterizer algorithm
- Embedded in Proteus software
- Using MALTA Cz un-irradiated

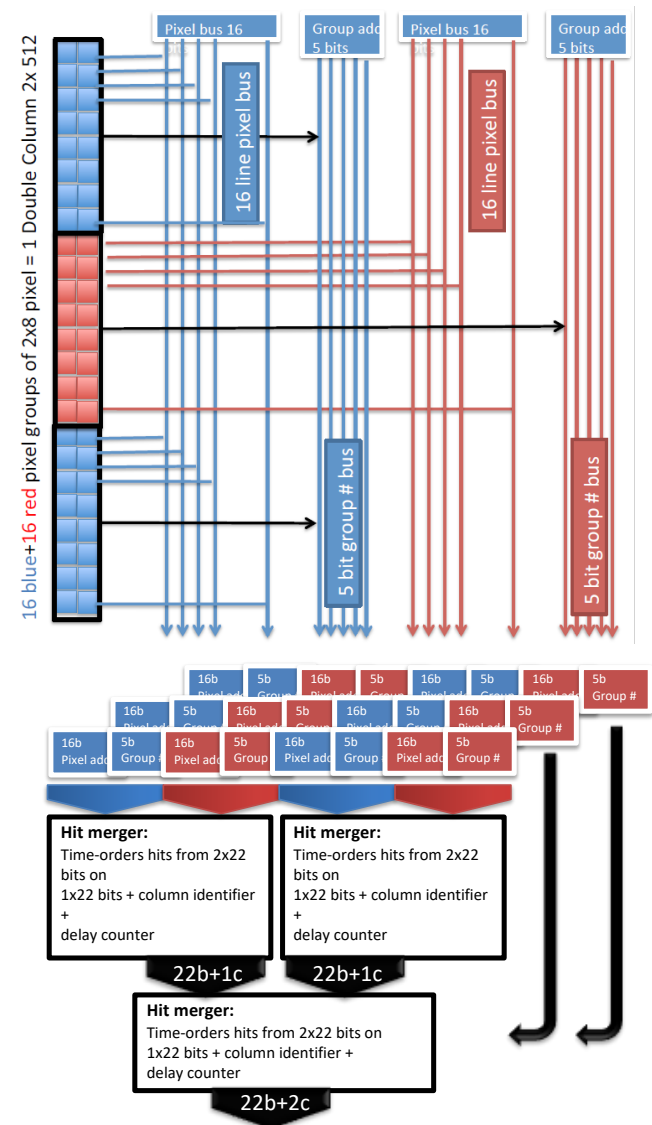

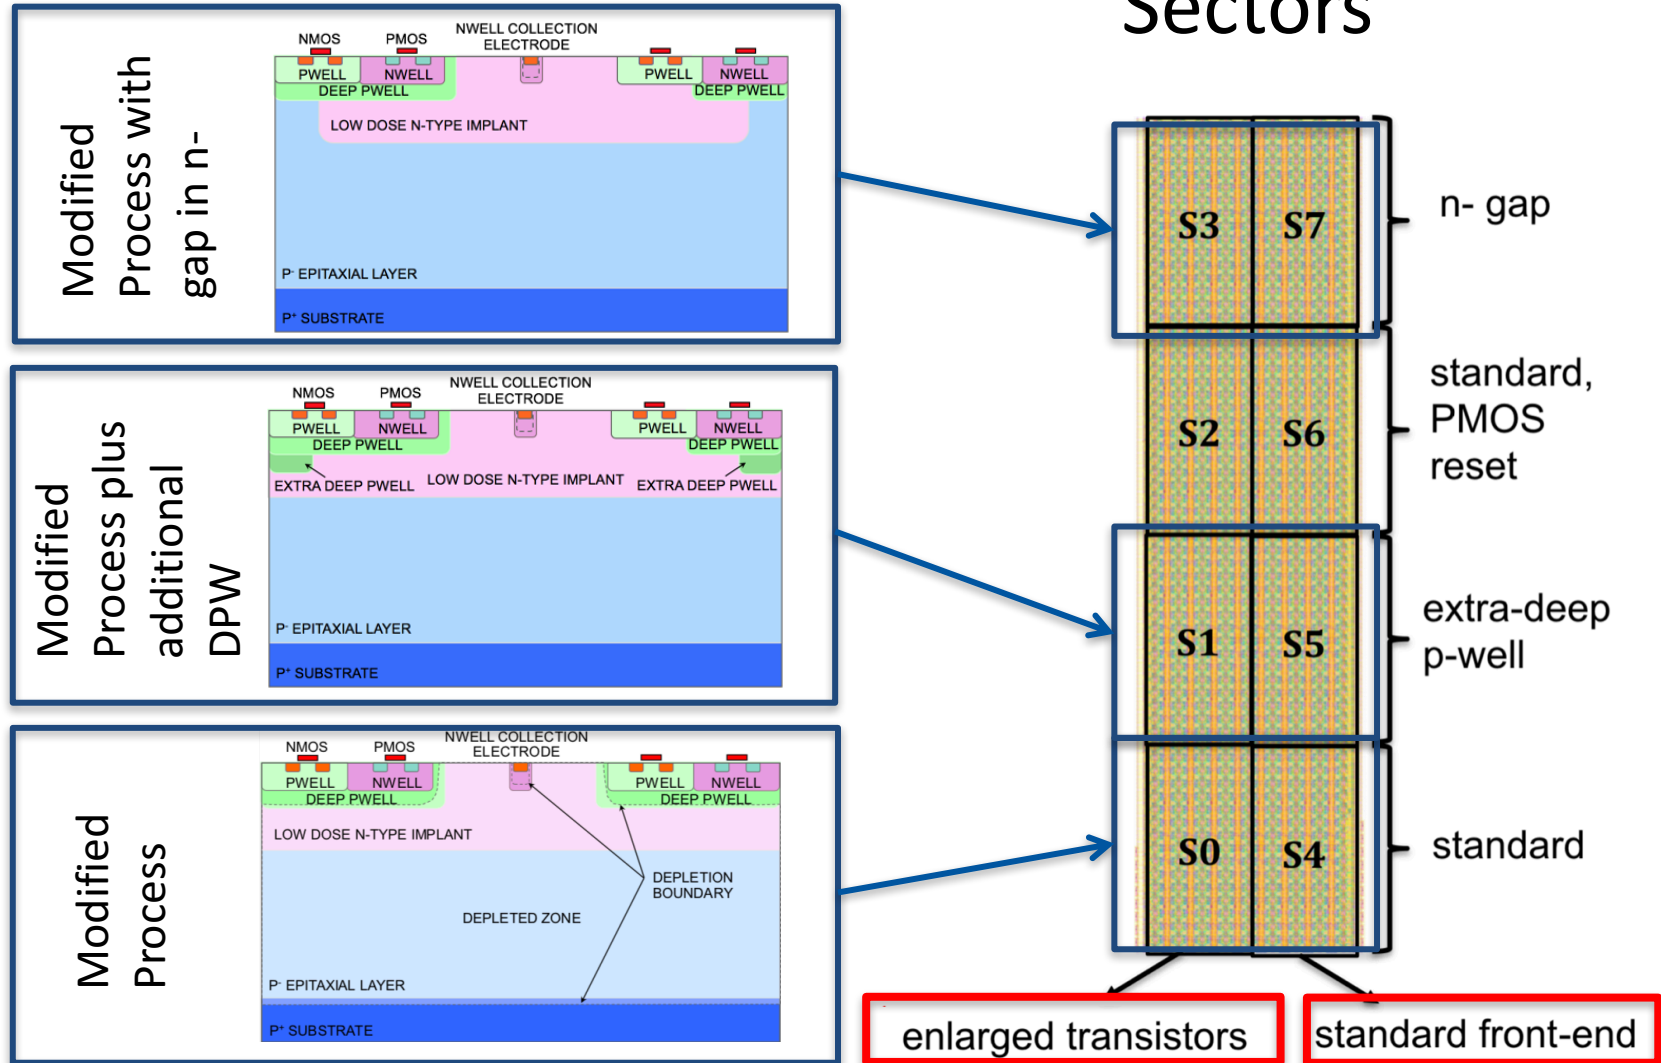

From ELSA test beam Apr 2019

# MALTA read-out architecture

- Novel asynchronous readout architecture for high hit rate capability with 40 bit parallel data bus for data streaming
  - Groups of 2x8 pixels with pattern assignment to reduce data size from clusters
  - Front-end discriminator output is processed by a double-column digital logic
  - Pulse width adjustable between 0.5 ns and 2 ns
  - Data transmitted asynchronously over high speed bus to end of column
- At the periphery, arbitration and merging resolves timing conflicts of simultaneous signals
  - Timing information stored in dedicated bits
  - Output signals transmitted by 5 Gbps LVDS driver
- Virtex VC707 implementation
  - 38 asynchronous oversample
  - 400ps hit arrival precision

# Mini-MALTA efficiency vs threshold

- Efficiency above 97% sensor modification with enlarged transitions
- Higher efficiency for enlarged transistors
- Efficiency above 90% after  $2e15 \text{ n}_{\text{eq}}/\text{cm}^2$  irradiation (see backup slide)

Efficiency versus threshold for two different Mini-MALTA samples, neutron irradiated to  $2e15 \text{ n}_{\text{eq}}/\text{cm}^2$ , and measured with 2 GeV electron beam at ELSA, with 6 V bias voltage
