## An Evaluation of Podman

*Thursday 15 October 2020 17:30 (20 minutes)*

Podman is the default container execution platform shipped with RHEL/CentOS 8, and is now also available in RHEL/CentOS/SL 7. It provides a user command line interface that is effectively identical to Docker's, and supports rootless container execution. In this talk we'll give an overview of Podman, our experiences with this software, and a comparison with Singularity and Docker.
