MySQL High Availability in the Database On Demand service

Monday, 12 October 2020 19:20 (20 minutes)

The DBOD Service is a Database as a Service platform that provides MySQL, PostgreSQL, and InfluxDB database instances to CERN users.

During the last few years, more and more critical services have moved to open source database solutions and are now making use of the DBOD service. As a consequence, high availability is expected for some of these services.

This presentation describes how to achieve High Availability for MySQL databases using ProxySQL. I will also present other open source alternatives for MySQL HA.
