Watching File Storage and Transfers with Elastic Stack at BNL

Wednesday 14 October 2020 19:10 (20 minutes)

The Elastic stack monitors several systems at BNL. At the SDCC two of these are BNLbox and Globus Connect Server. BNLBox- an implementation of nextcloud- is a service for file storing and sharing while Globus is a platform for file transfers. In this talk I will present how we configured Elastic and its components and how they give us insights into client app usage via log ingestion (filebeats) and system monitoring (metricbeats).
