Invenio Based Digital Repositories at BNL

Monday, 12 October 2020 18:40 (20 minutes)

A Research Digital Management (RDM) repository is a web based service that would provide BNL's scientific community a means to share and preserve their scientific results while making them Findable, Accessible, Interoperable, and Reusable (FAIR). Towards this goal Invenio, an open-source software framework for building large-scale digital repositories, is being used to create a research data management platform called InvenioRDM. An overview of the invenio service at BNL and the status of invenioRDM development will be provided in this talk.
