

Higgs Session Discussion

Giuliano Panico, Meng Xiao, Kerstin Tackmann

June 10, 2021

Questions for discussion

- Measurements and searches on full Run2 data are in progress -- are we missing any important measurements or searches?
- What are the limitations of the measurements and where do we need progress on the experimental and theory side to overcome these?
- Which ingredients are still missing for a combination of single and double Higgs analyses? Which framework is to be used? (talk by R. Grober)
- Which computations are still missing but will be essential for the HL-LHC?
- Prospects for reducing systematics at HL-LHC? Some single Higgs analyses (eg. Higgs production) are close to be dominated by systematics (talk by H. Abidi)
