LHCP2021
The Ninth Annual Conference on Large Hadron Collider Physics
Online
7-12 June 2021 Paris (France), Sorbonne Université (IN2P3/CNRS,IRFU/CEA)

Heavy-flavour collectivity in heavy–ion collisions

Fabrizio Grosa on behalf of the ALICE, ATLAS, and CMS Collaborations
CERN

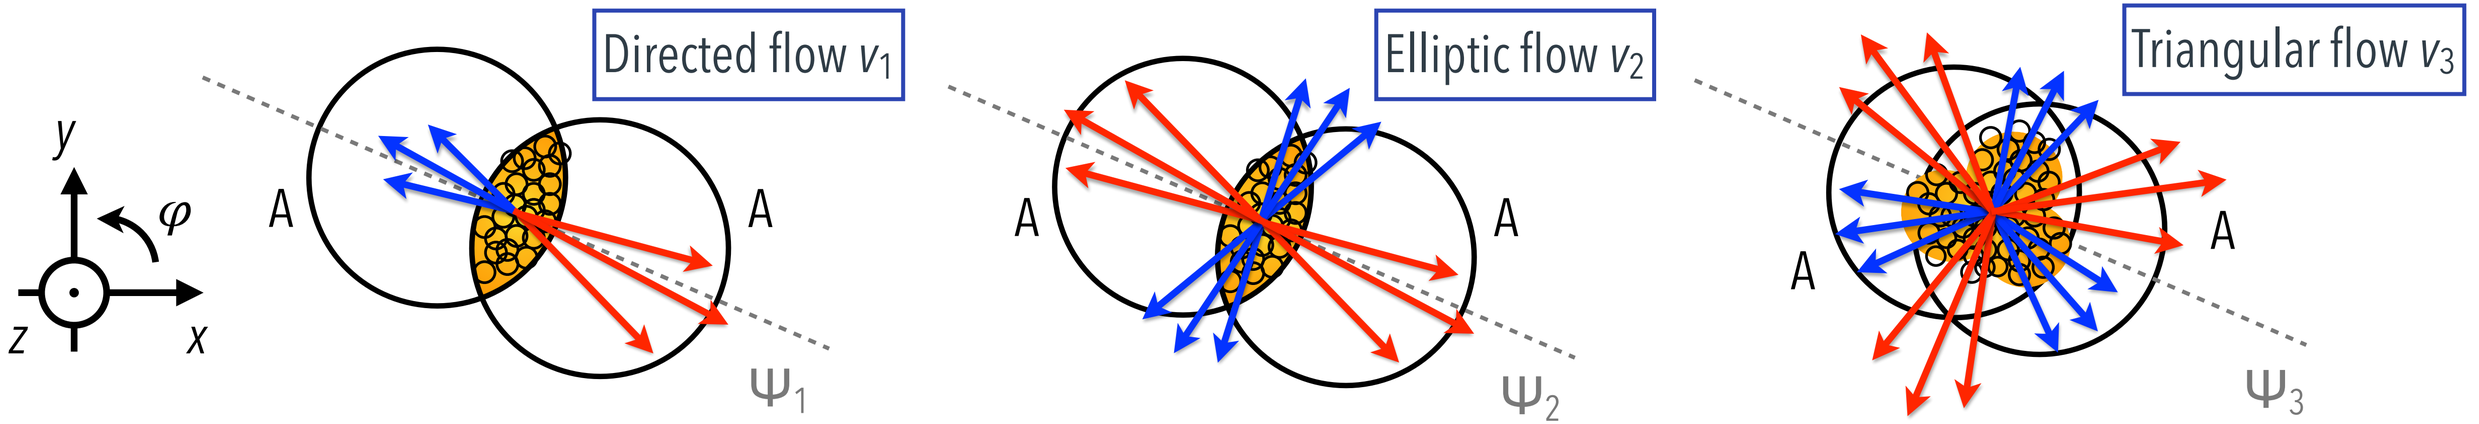
Azimuthal anisotropies of HF particles in the QGP

F. Grosa (CERN)
fgrosa@cern.ch

- a colour-deconfined medium, called *quark–gluon plasma* (QGP) is created in ultrarelativistic heavy-ion collisions
- The initial geometrical anisotropy is transferred to a momentum anisotropy by the pressure gradients

$$E\frac{\mathrm{d}^3N}{\mathrm{d}p_\mathrm{T}} = \frac{1}{2\pi}\frac{\mathrm{d}^2N}{p_\mathrm{T}\mathrm{d}p_\mathrm{T}\mathrm{d}y}\left\{1 + \sum_{i=1}^{\infty} v_\mathrm{n}\cos[\mathrm{n}(\varphi - \Psi_\mathrm{n})]\right\}$$

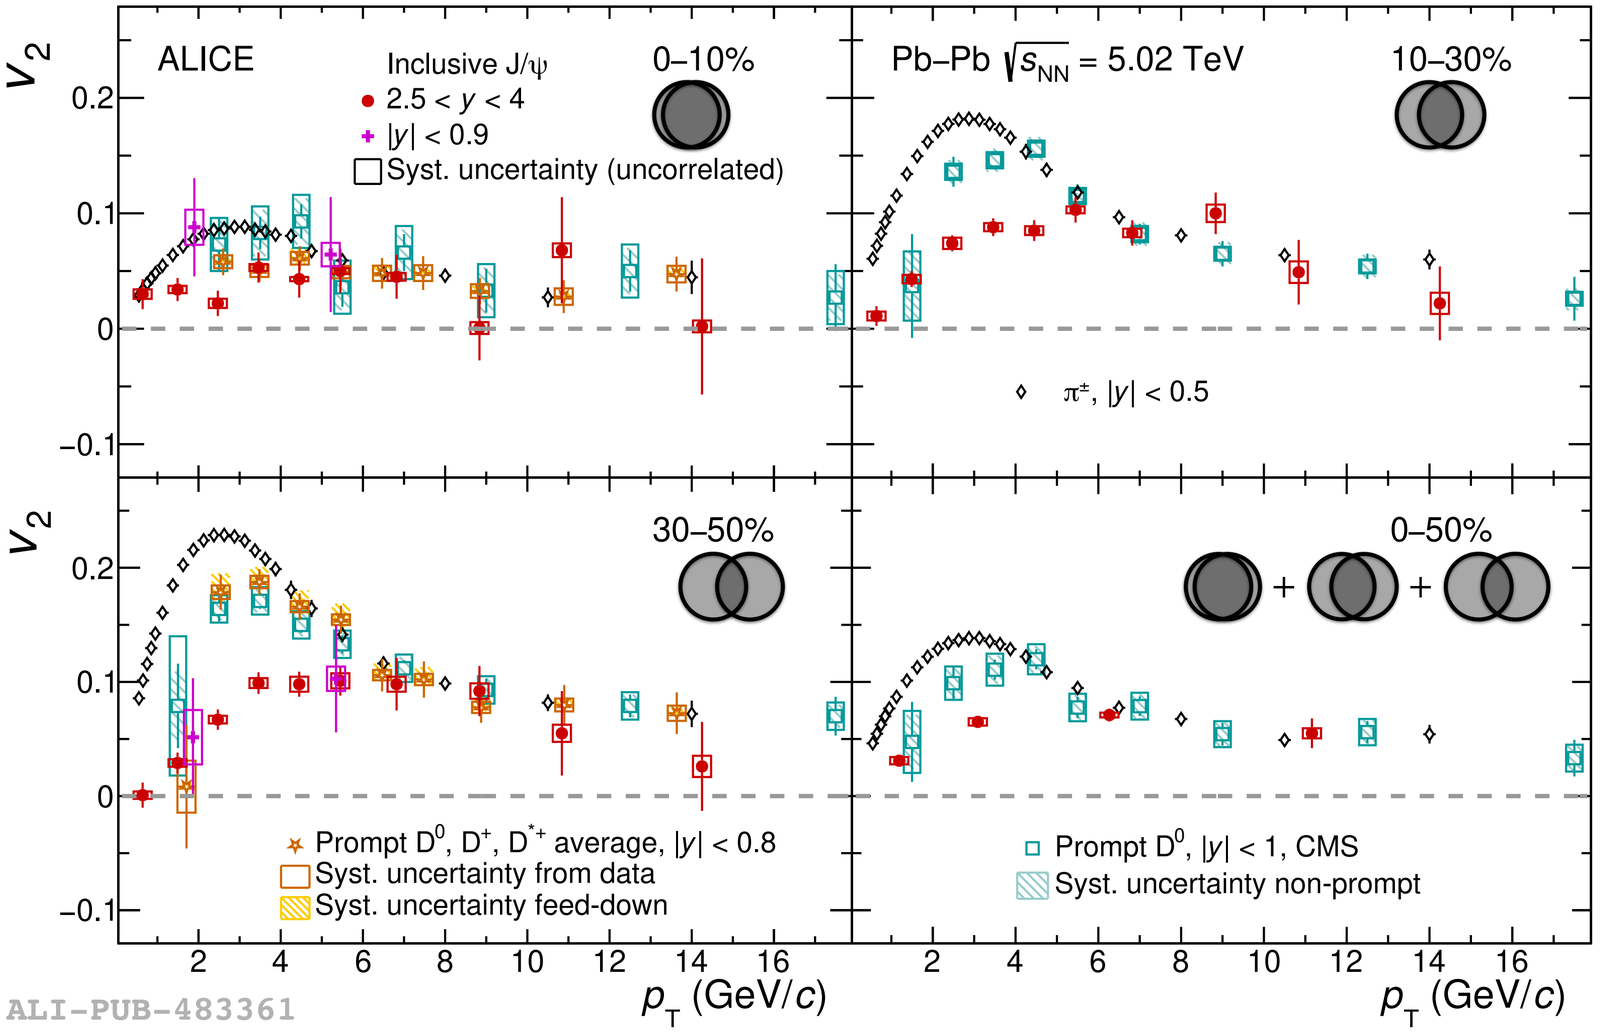
$$v_\mathrm{n} = \langle\cos[\mathrm{n}(\varphi - \Psi_\mathrm{n})]\rangle$$ Flow harmonic coefficients



- Azimuthal anisotropy in HF hadron production
  - ➡ Participation of charm and beauty quarks in the collective motions and their possible thermalisation
  - ➡ Study path-length dependence of in-medium parton energy loss
  - ➡ Sensitivity to initial-state event-by-event fluctuations
  - ➡ Probe strong initial electromagnetic fields in the QGP

Elliptic flow of open and hidden charm mesons

F. Grosa (CERN)
fgrosa@cern.ch

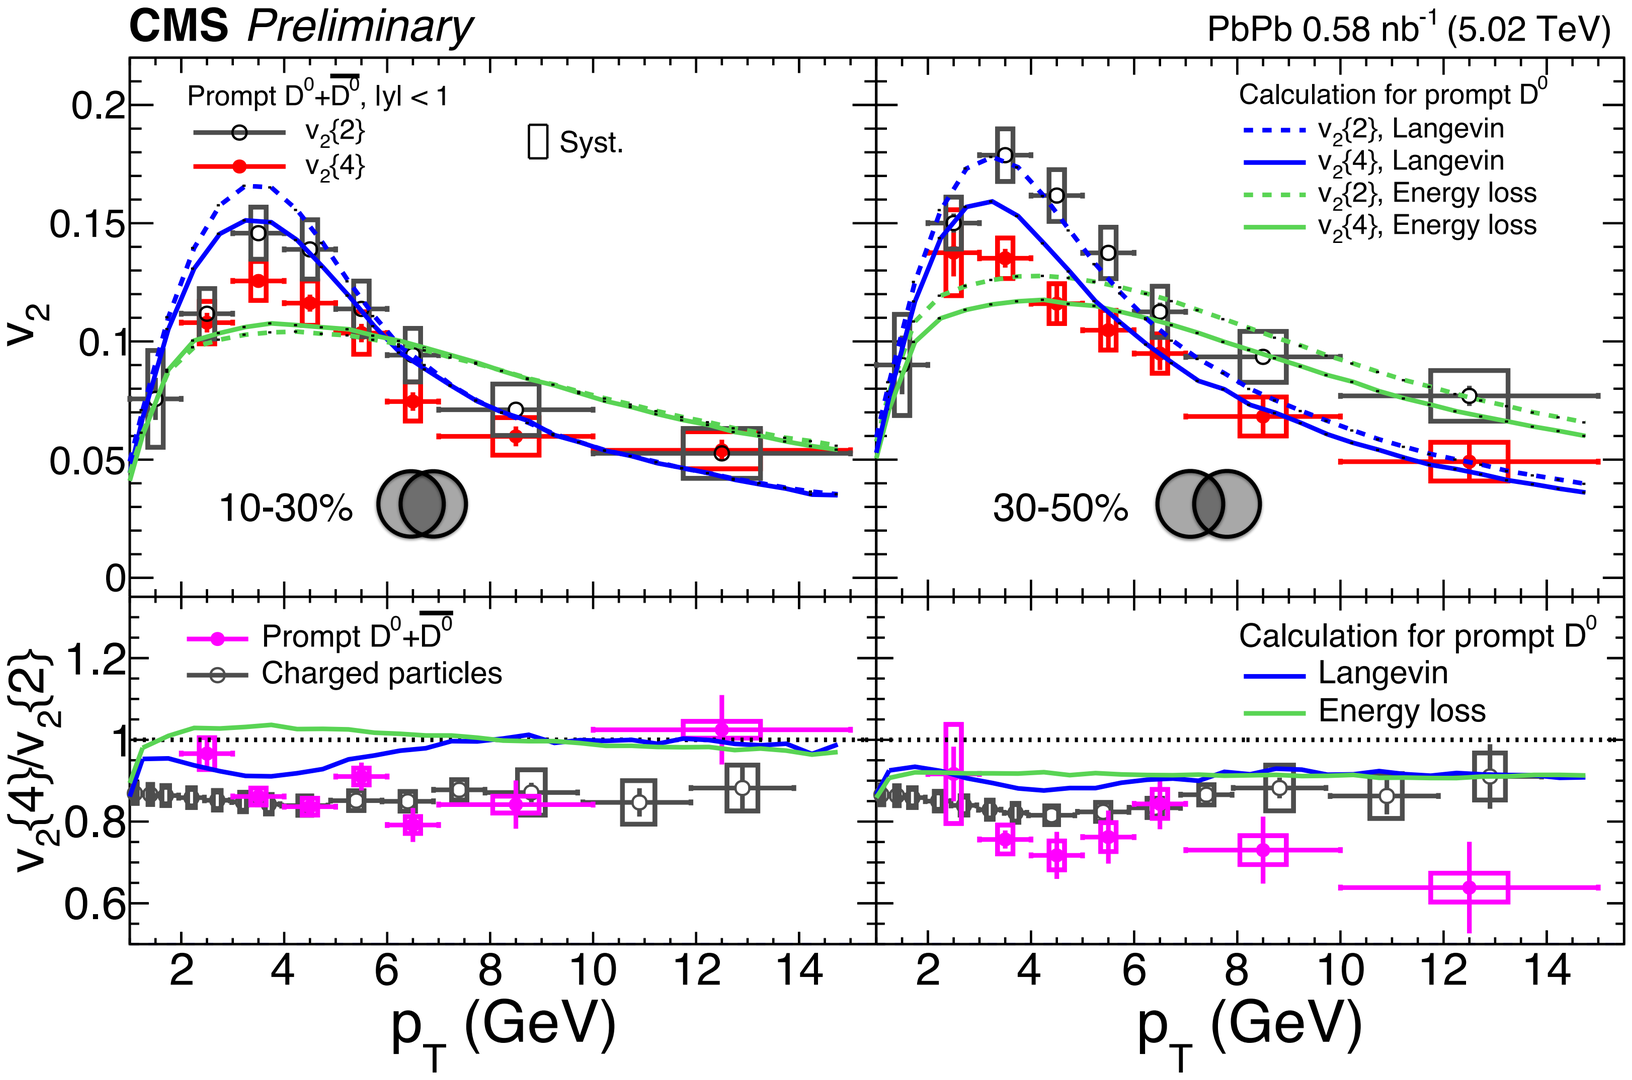


- Significant v_2 for open and hidden charm mesons → charm participation to collective motions
- p_T < 3–4 GeV/c: mass hierarchy
  - ➡ $v_2(J/\psi) < v_2(D,D^0) < v_2(\pi)$
- 3–4 < p_T < 6–8 GeV/c: coalescence
  - ➡ $v_2(J/\psi) < v_2(D,D^0) = v_2(\pi)$
- p_T > 8 GeV/c: path-length dependence of in-medium energy loss
  - ➡ $v_2(J/\psi) = v_2(D,D^0) = v_2(\pi)$

ALICE prompt D: PLB 813 (2021) 136054
ALICE J/ψ forward y: JHEP 10 (2020) 141
ALICE $\pi^{\pm}$: JHEP 09 (2018) 006
CMS prompt D^0: PRL 120 (2018) 202301
ALICE J/ψ mid y: JHEP 10 (2020) 141

D-meson $v_2\{2\}$ vs. $v_2\{4\}$

F. Grosa (CERN)
fgrosa@cern.ch

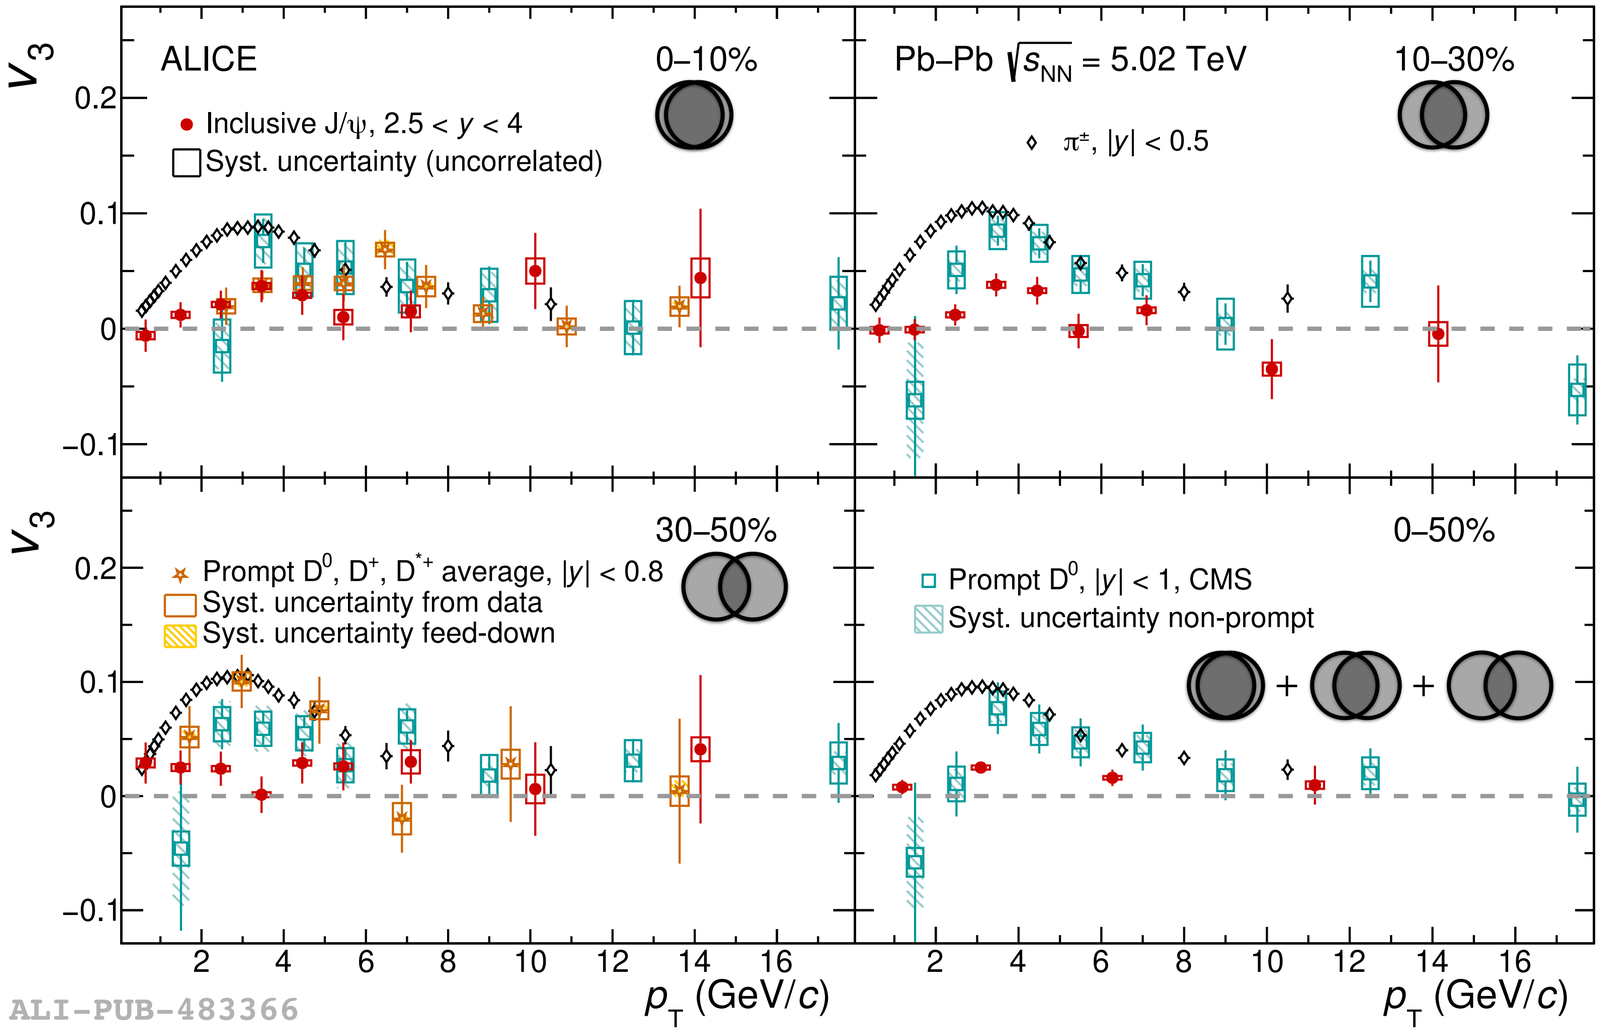


- D-meson $v_2\{4\}$ smaller than $v_2\{2\}$
  - ➡ Expected in case of event-by-event fluctuations in the flow signal
- Similar effect for charm and light hadrons
- Described by theoretical models based on charm-quark transport in a hydrodynamically expanding QGP

CMS prompt D⁰: CMS-PAS-HIN-20-001

Triangular flow of open and hidden charm mesons

F. Grosa (CERN)
fgrosa@cern.ch



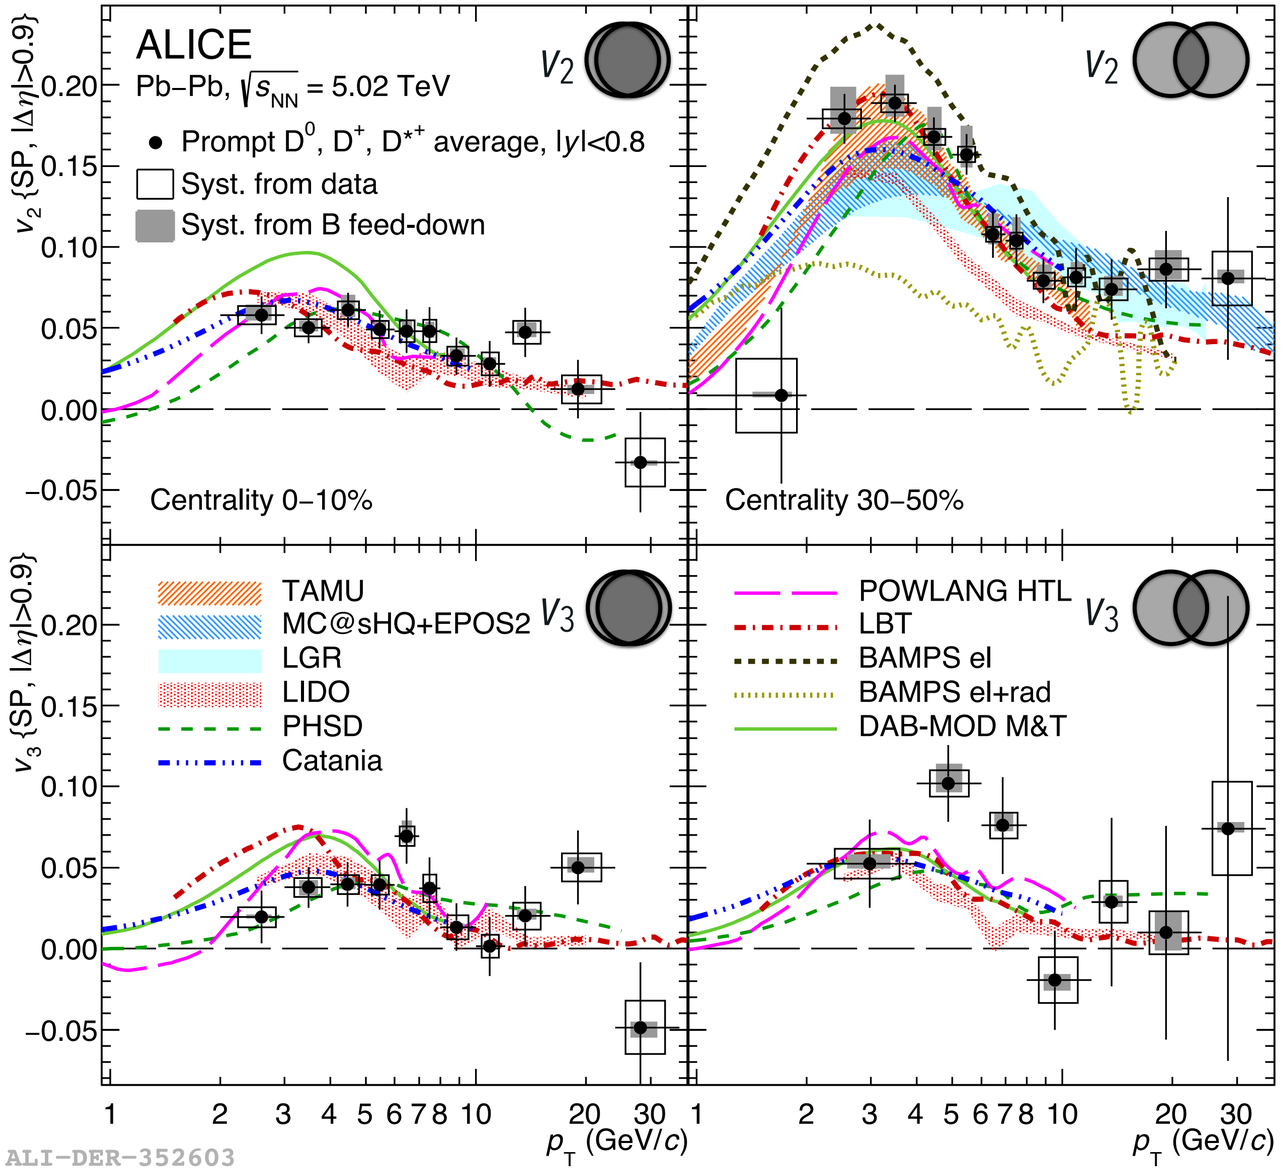
- Significant v_3 for open and hidden charm mesons → charm sensitive to initial-state event-by-event fluctuations
- p_T < 3–4 GeV/c: mass hierarchy
  - ➡ $v_3(J/\psi) < v_3(D,D^0) < v_3(\pi)$
- 3–4 < p_T < 6–8 GeV/c: coalescence
  - ➡ $v_3(J/\psi) < v_3(D,D^0) = v_3(\pi)$
- p_T > 8 GeV/c: path-length dependence of in-medium energy loss
  - ➡ $v_3(J/\psi) = v_3(D,D^0) = v_3(\pi)$

ALICE prompt D: PLB 813 (2021) 136054
CMS prompt D⁰: PRL 120 (2018) 202301
ALICE J/ψ forward y: JHEP 10 (2020) 141
ALICE $\pi^{\pm}$: JHEP 09 (2018) 006

D-meson azimuthal anisotropy vs. transport models

F. Grosa (CERN)
fgrosa@cern.ch

ALICE prompt D: PLB 813 (2021) 136054



ALI-DER-352603

- Transport of charm quarks in an hydrodynamically expanding medium via Boltzmann or Langevin equations
  - diffusion coefficient D_s related to thermalisation time of charm quark

$$1.5 < 2\pi D_s T_c < 7$$

for models that describe data with $\chi^2/\mathrm{ndf} < 2$

$$\tau_{\mathrm{charm}} = (m_{\mathrm{charm}}/T) \cdot D_s = 3 - 14 \ \mathrm{fm}/c \approx \tau_{\mathrm{QGP}}$$

Summary and conclusions

F. Grosa (CERN)
fgrosa@cern.ch

- Charm-quark flow: positive v_2 and v_3 of open and hidden charm mesons, correlated with light hadrons
  - ➡ Indicate significant degree of thermalisation of charm quarks in the QGP
  - ➡ Indicate sensitivity to initial-state event-by-event fluctuations
  - ➡ Contribution from charm-quark hadronisation via coalescence

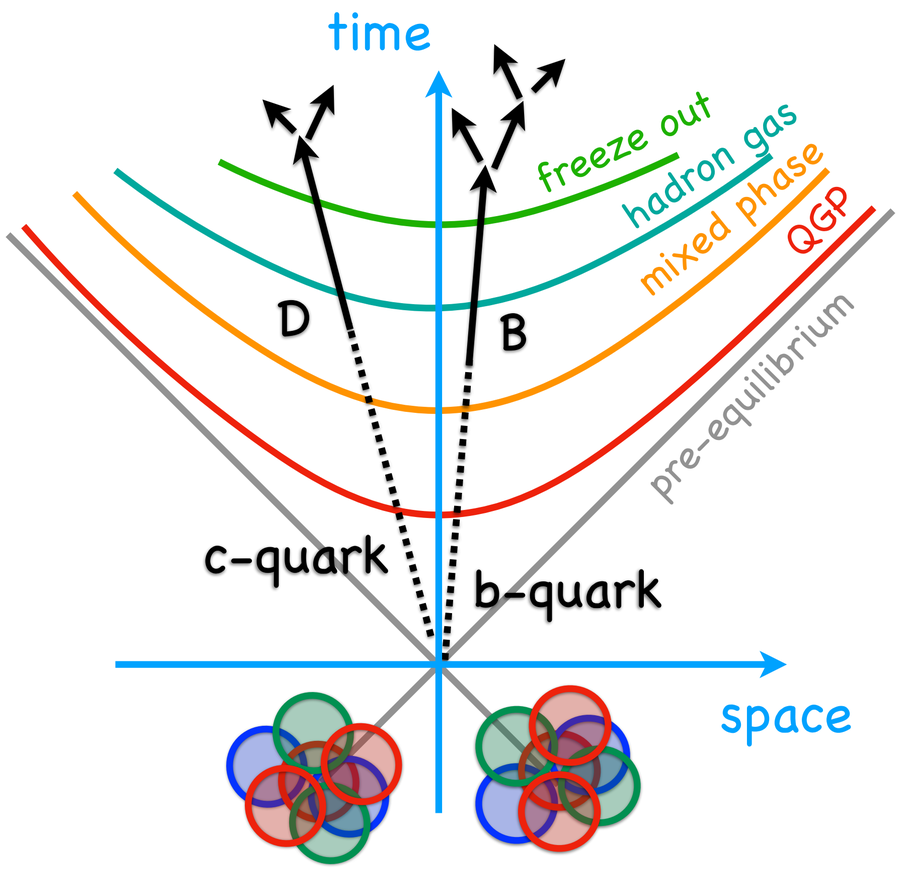
- Search for strong early electromagnetic fields in heavy-ions
  - ➡ Electric field: no significant D-meson charge-dependent v_2
  - ➡ Magnetic field: hint of D-meson charge-dependent v_1

- Beauty-quark flow: positive v_2 for open-beauty hadrons, no significant v_2 for bottomonia
  - ➡ Does beauty quark flow?
  - ➡ Only contribution from beauty-quark hadronisation via coalescence?

ADDITIONAL SLIDES

Heavy flavours in the QGP

F. Grosa (CERN)
fgrosa@cern.ch



- QCD calculations on lattice predict a phase transition from the ordinary nuclear matter to a colour-deconfined medium, called *quark–gluon plasma* (QGP)
  - ➡ created in ultrarelativistic heavy–ion collisions
  - ➡ very high energy density $\varepsilon > 15$ GeV/fm^3
  - ➡ after a pre-equilibrium phase expands hydrodynamically

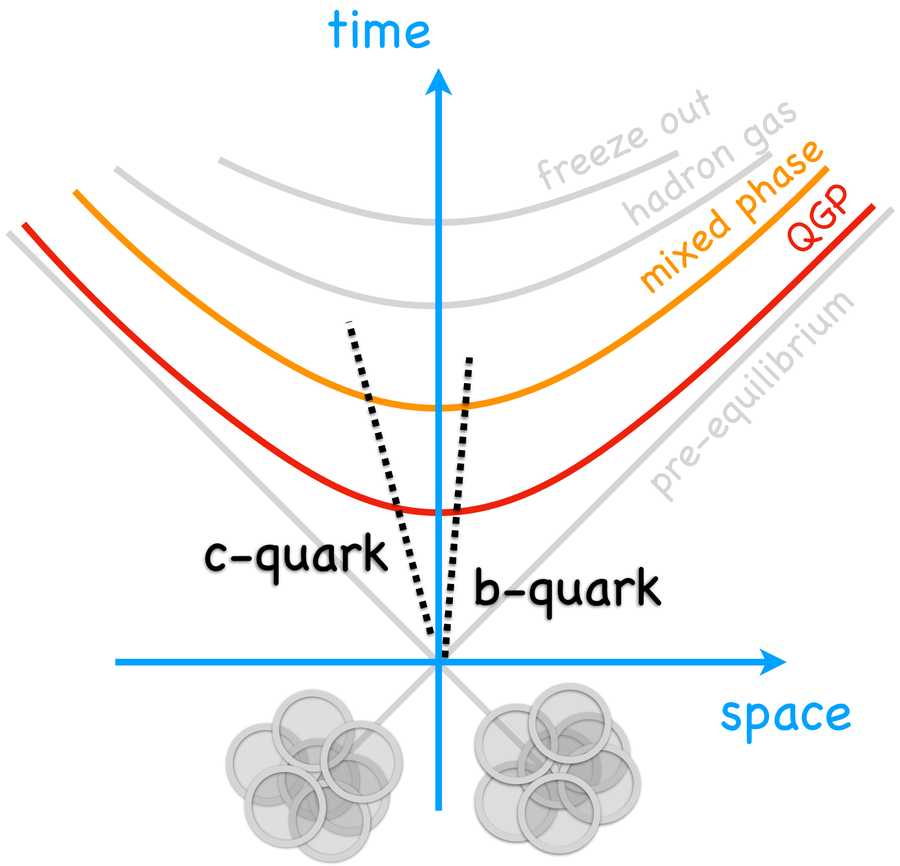
- Heavy flavours: produced in shorter time scales than QGP formation time
  - ➡ $\tau_{\mathrm{HF}} \leq \hbar/m \approx 0.05\text{-}0.1$ fm/c depending on p_{T}
  - ➡ $\tau_{\mathrm{QGP\ form}}$ (LHC) ≈ 0.3 fm/c

  } HF experience the full system evolution

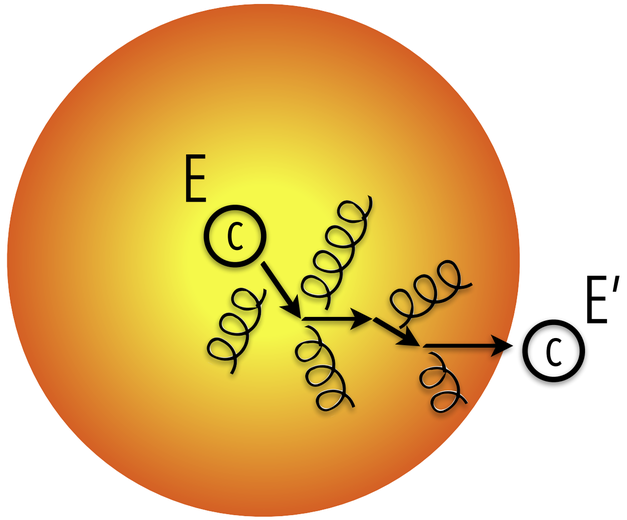
📚 PRC 89 (2014) 034906

Heavy-flavour interactions in the QGP

F. Grosa (CERN)
fgrosa@cern.ch



- HF propagate in the QGP with a Brownian motion
  - ➡ interact with medium constituents
  - ➡ loose energy via elastic collisions and radiative processes
  - ➡ heavy-quark thermalisation in the QGP?



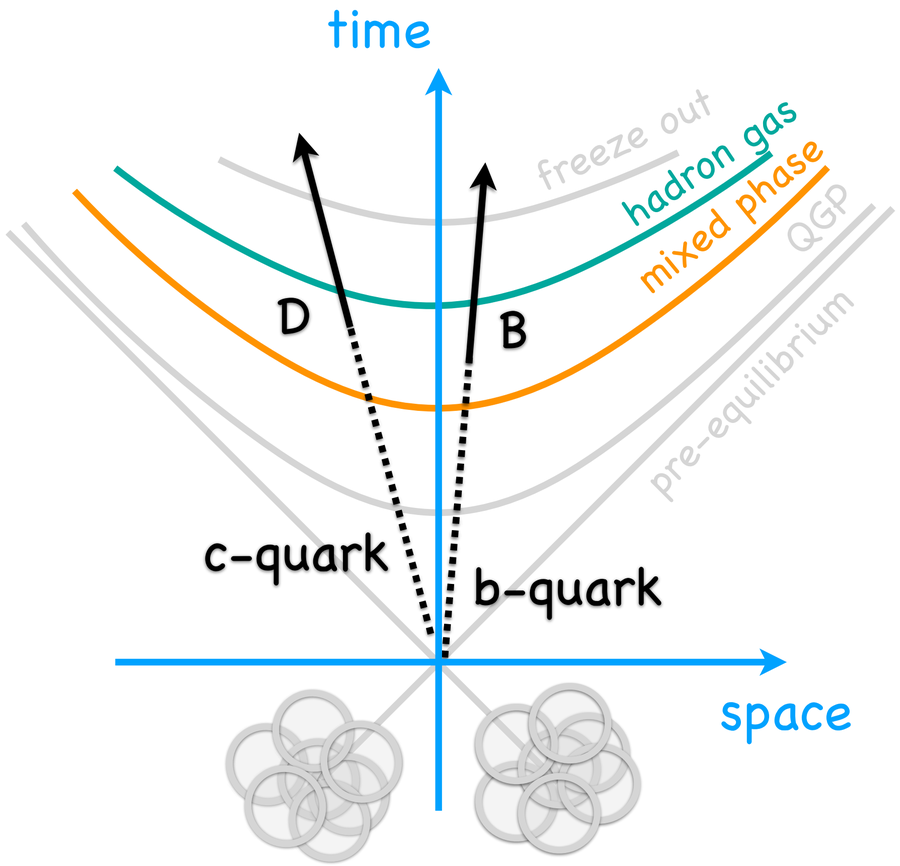
- ➡ $\tau_{HF} \lesssim \hbar/m \approx 0.05\text{-}0.1$ fm/c depending on p_T
- ➡ $\tau_{QGP\ form}$ (LHC) ≈ 0.3 fm/c

  PRC 89 (2014) 034906
- ➡ $\tau_{QGP\ lifetime} \approx 10$ fm/c

  PLB 696 (2011) 328-315

Heavy-flavour hadronisation in the QGP

F. Grosa (CERN)
fgrosa@cern.ch



- Competing mechanisms for the HF hadronisation in the QGP

  1. Fragmentation $D_{q\to h}(z_q, Q^2)$

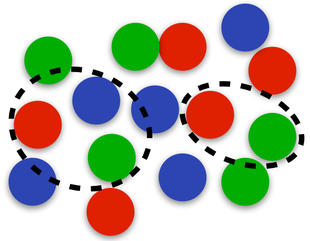
     ➡ energy-loss of partons while traversing the QGP modifies fraction of the parton momentum z_q taken by the hadron

     - equal for all hadron species

  2. Coalescence

     ➡ partons close in phase space can recombine into hadrons

     ➡ quarks with different mass coalesce if have similar velocities



PRL 90 (2003) 202302
PRL 90 (2003) 202303
PRC 67 (2003) 064902
PLB 595 (2004) 202-208

- Statistical hadronisation model

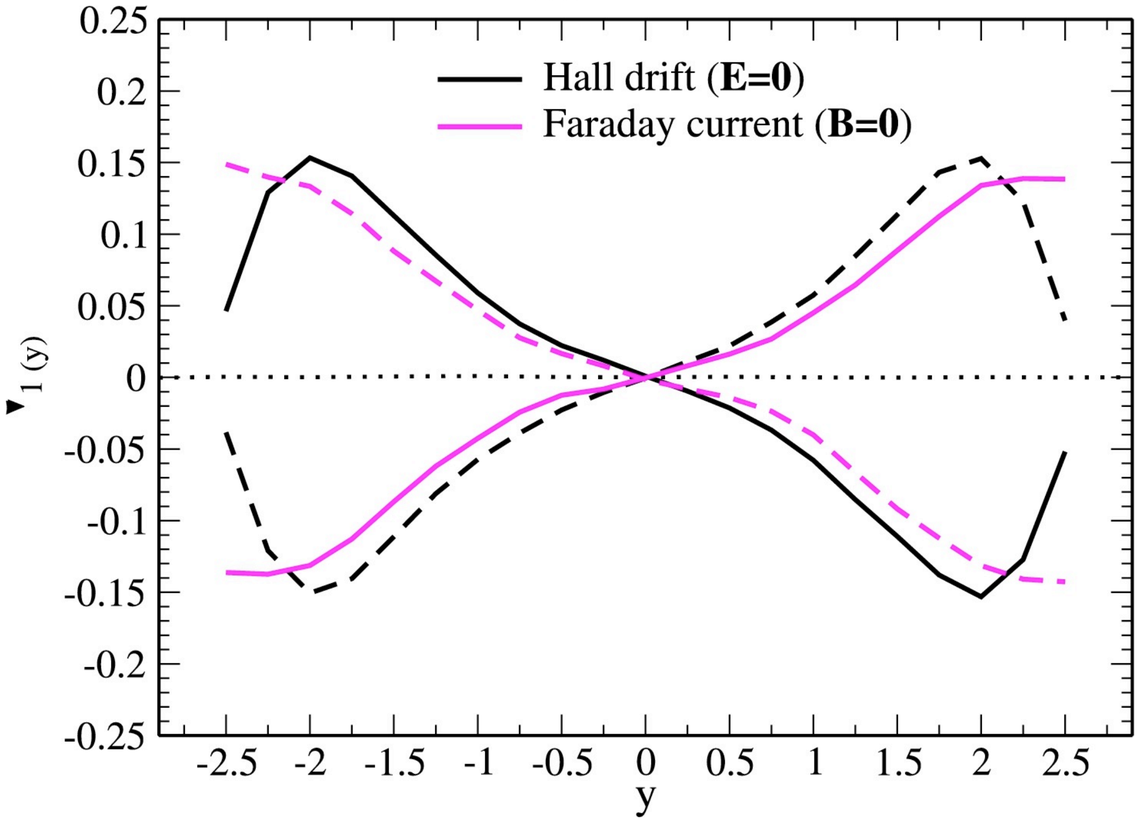
  ➡ Hadrons emitted from the interaction region in statistical equilibrium at the QGP phase boundary

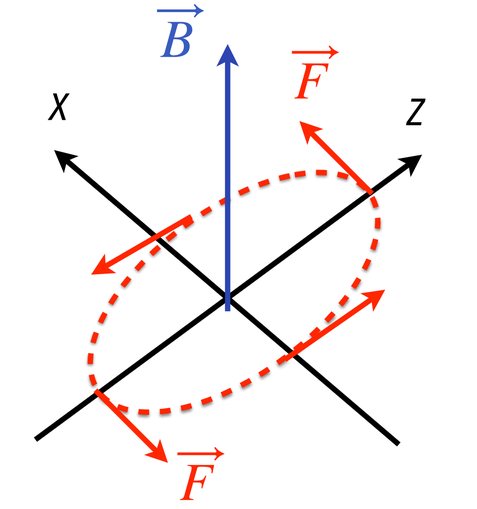
PLB (2008) 659:149-155

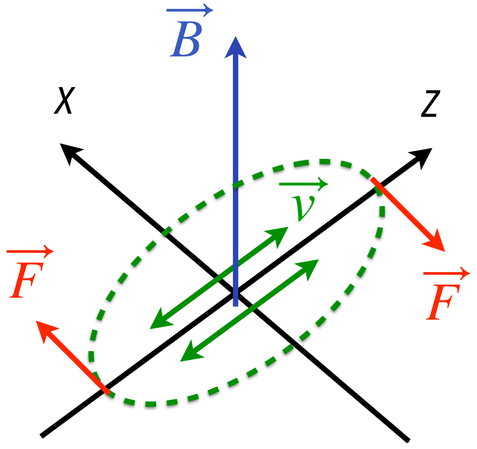
Charge-dependent directed flow

F. Grosa (CERN)
fgrosa@cern.ch

S. K. Das et al, PLB 768 (2017) 260-264



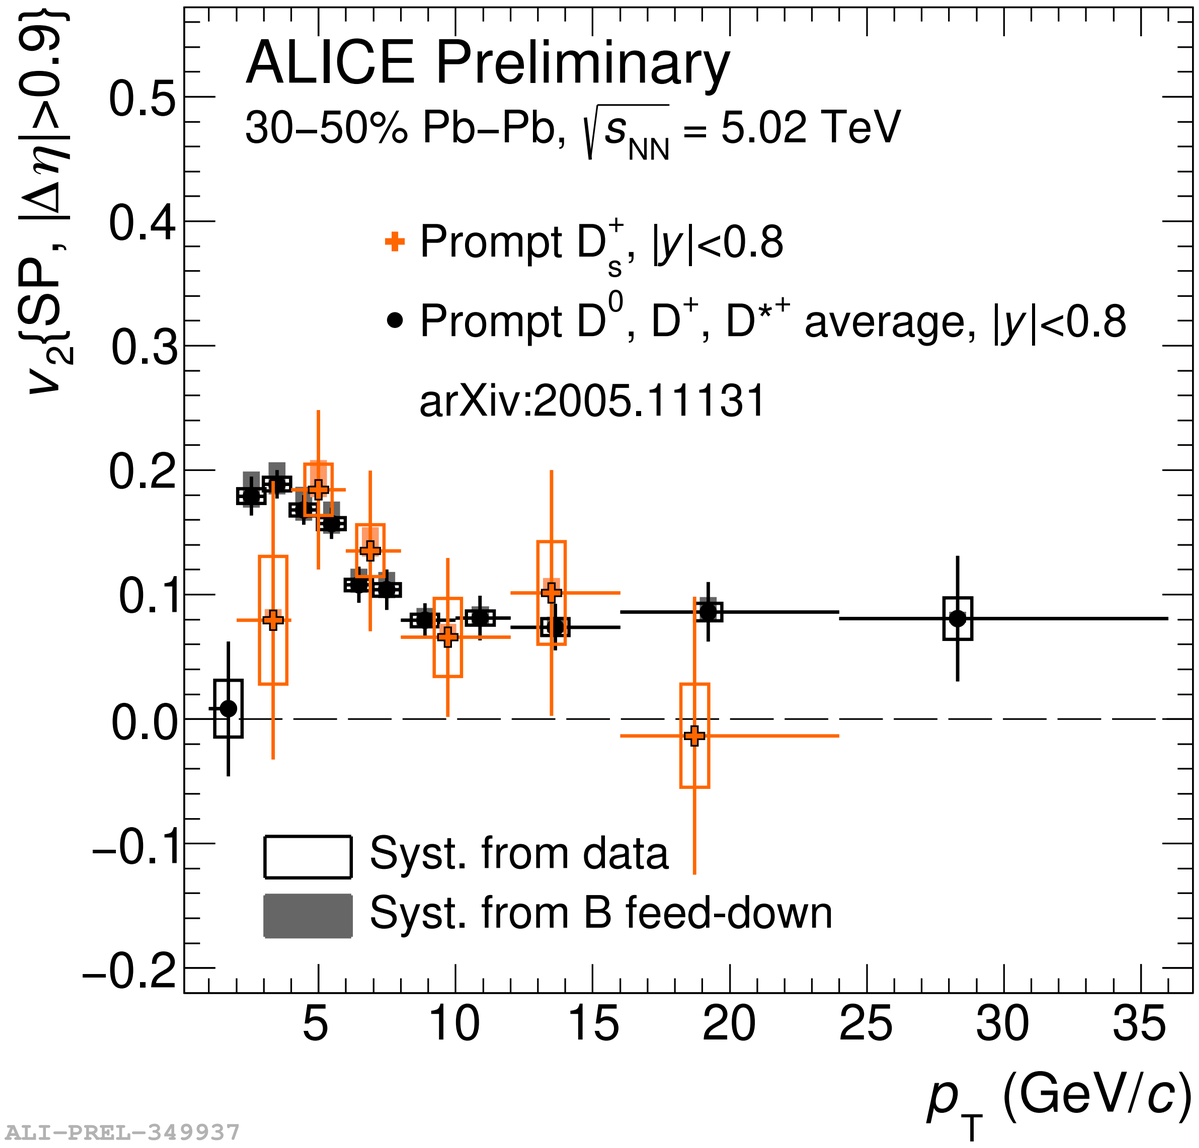




- Originated by two competing effects:
  - ➡ Faraday effect: electric field induced by decreasing $\vec{B}$
  - ➡ Hall effect: Lorentz force induced by moving charges $\vec{F} = q\vec{v} \times \vec{B}$

Strange D-meson elliptic flow

F. Grosa (CERN)
fgrosa@cern.ch



ALICE prompt D: PLB 813 (2021) 136054

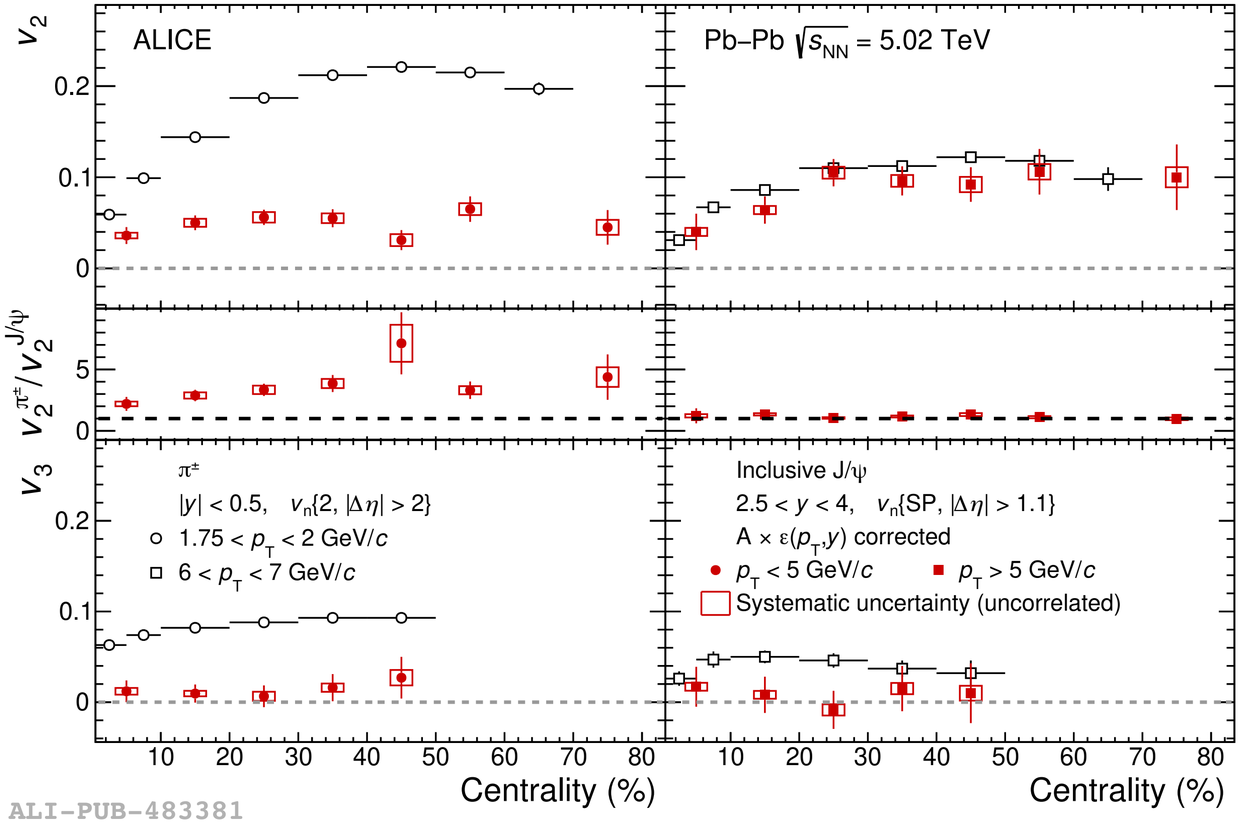
ALICE prompt D_s^+: preliminary

- No significant difference between D_s^+ and non-strange D mesons within current uncertainties

ALI-PREL-349937

Centrality and rapidity dependence of charm meson elliptic flow

F. Grosa (CERN)
fgrosa@cern.ch



ALI-PUB-483381

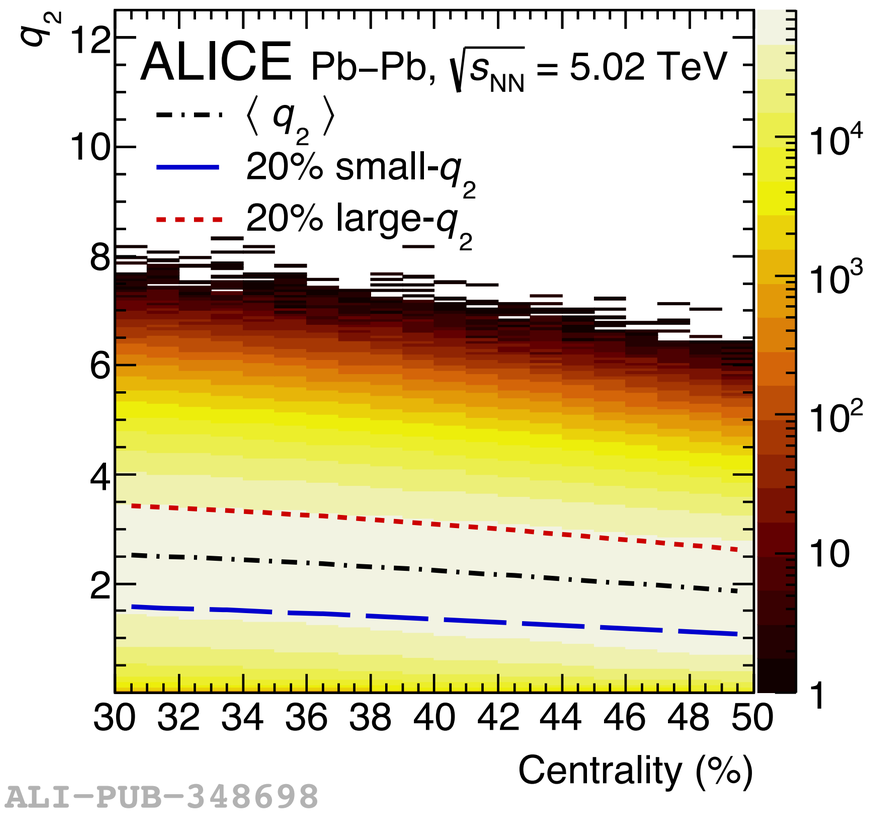
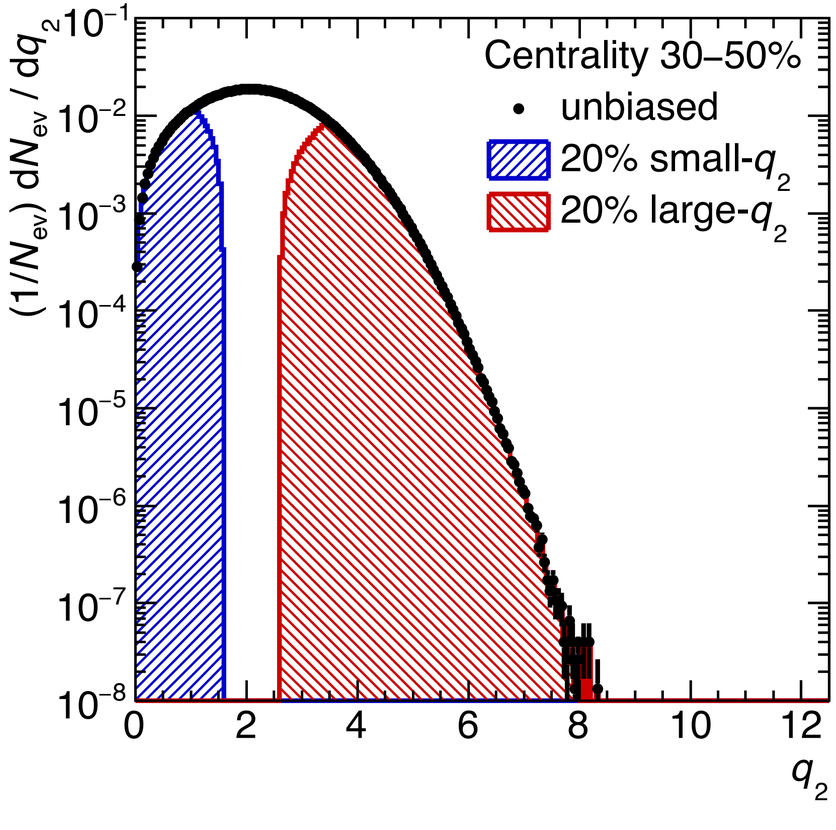
Event-shape engineering for the D-meson elliptic flow

F. Grosa (CERN)
fgrosa@cern.ch

PLB 813 (2021) 136054

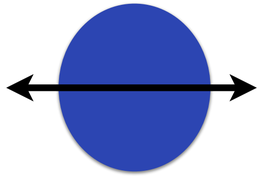




- The event-shape engineering (ESE) technique relies on the classification of events at a certain centrality according to the magnitude of the second-harmonic reduced flow vector:

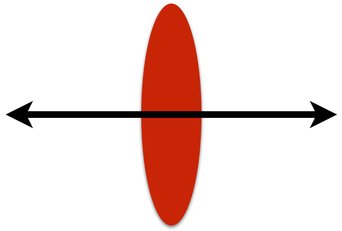
$$q_2 = |\vec{Q}_2|/\sqrt{M}$$

$$\vec{Q}_2 = \sum_{j=1}^{M} e^{i2\varphi_j}$$



20% smallest q_2^{TPC}

$\langle v_2 \rangle_{\mathrm{small}-q_2} < \langle v_2 \rangle_{\mathrm{unb}}$

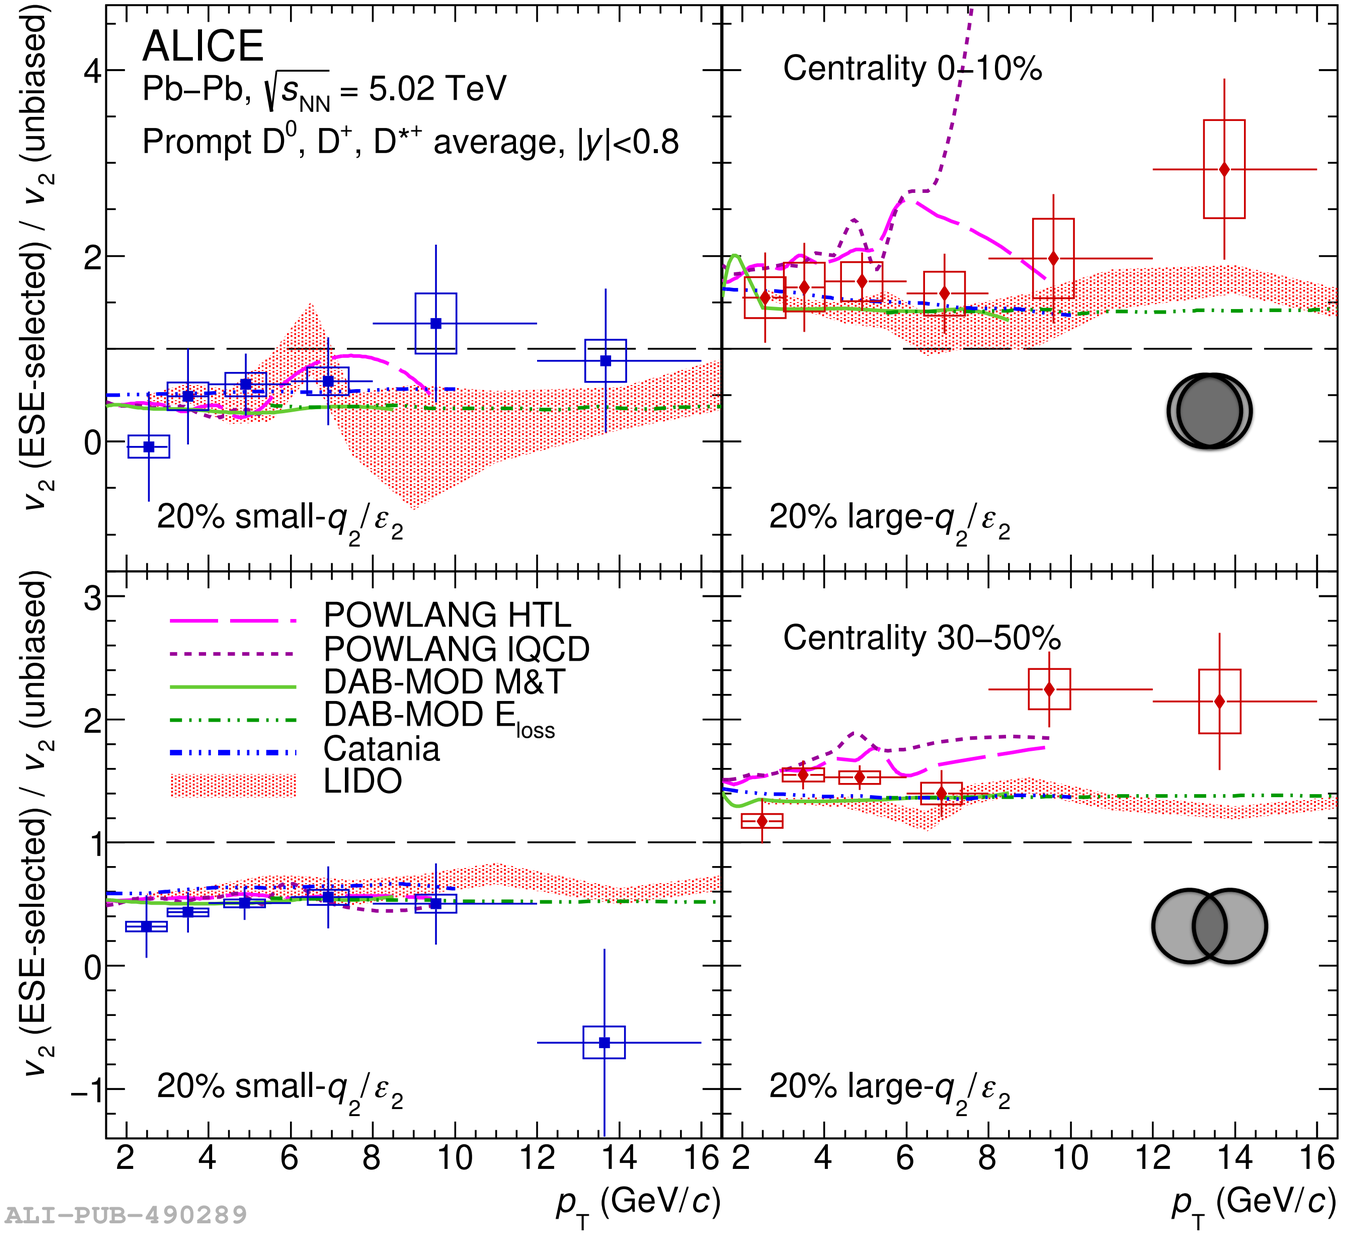


20% largest q_2^{TPC}

$\langle v_2 \rangle_{\mathrm{large}-q_2} > \langle v_2 \rangle_{\mathrm{unb}}$

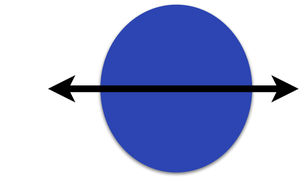
ESE elliptic flow ratios

F. Grosa (CERN)
fgrosa@cern.ch



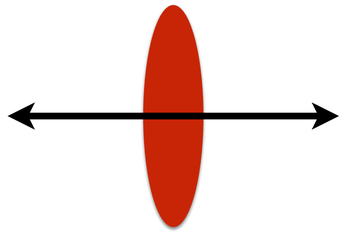
ALICE prompt D: PLB 813 (2021) 136054

- Models based on charm-quark transport in an hydrodynamically expanding medium describe q_2 dependence of D-meson v_2 flow
- Predicted variation of D-meson v_2 in ESE-selected samples with respect to unbiased sample similar for different transport parameters (e.g. POWLANG HTL vs. lQCD)



20% smallest q_2^{TPC}

$\langle v_2 \rangle_{\text{small}-q_2} < \langle v_2 \rangle_{\text{unb}}$



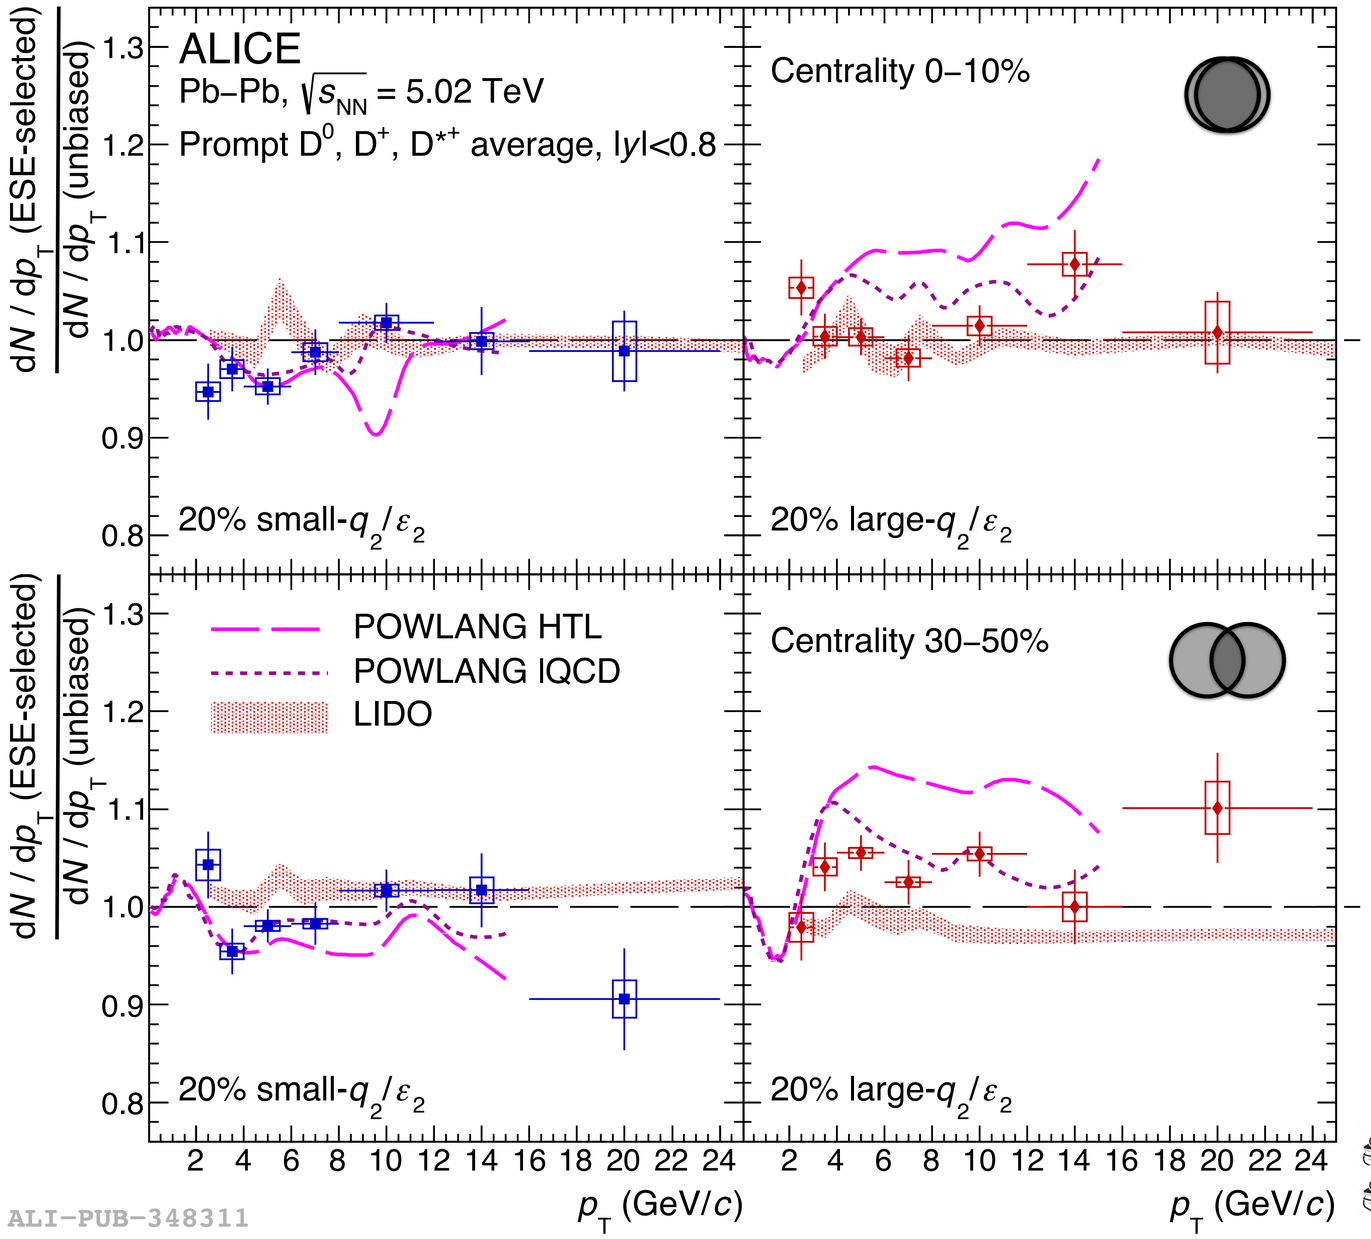
20% largest q_2^{TPC}

$\langle v_2 \rangle_{\text{large}-q_2} > \langle v_2 \rangle_{\text{unb}}$

POWLANG: EPJC (2019) 79:494
DAB-MOD: PRC 102 (2020) 024906
Catania: PLB 805 (2020) 135460
LIDO: PRC 98 (2018) 064901

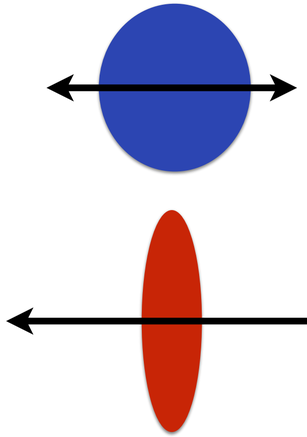
ESE yield ratios

F. Grosa (CERN)
fgrosa@cern.ch



ALICE prompt D: PLB 813 (2021) 136054

- No significant modification of the p_T-differential production yields of D-mesons in different ESE-selected samples of events



20% smallest q_2^{TPC}

$\langle v_2 \rangle_{\text{small}-q_2} < \langle v_2 \rangle_{\text{unb}}$

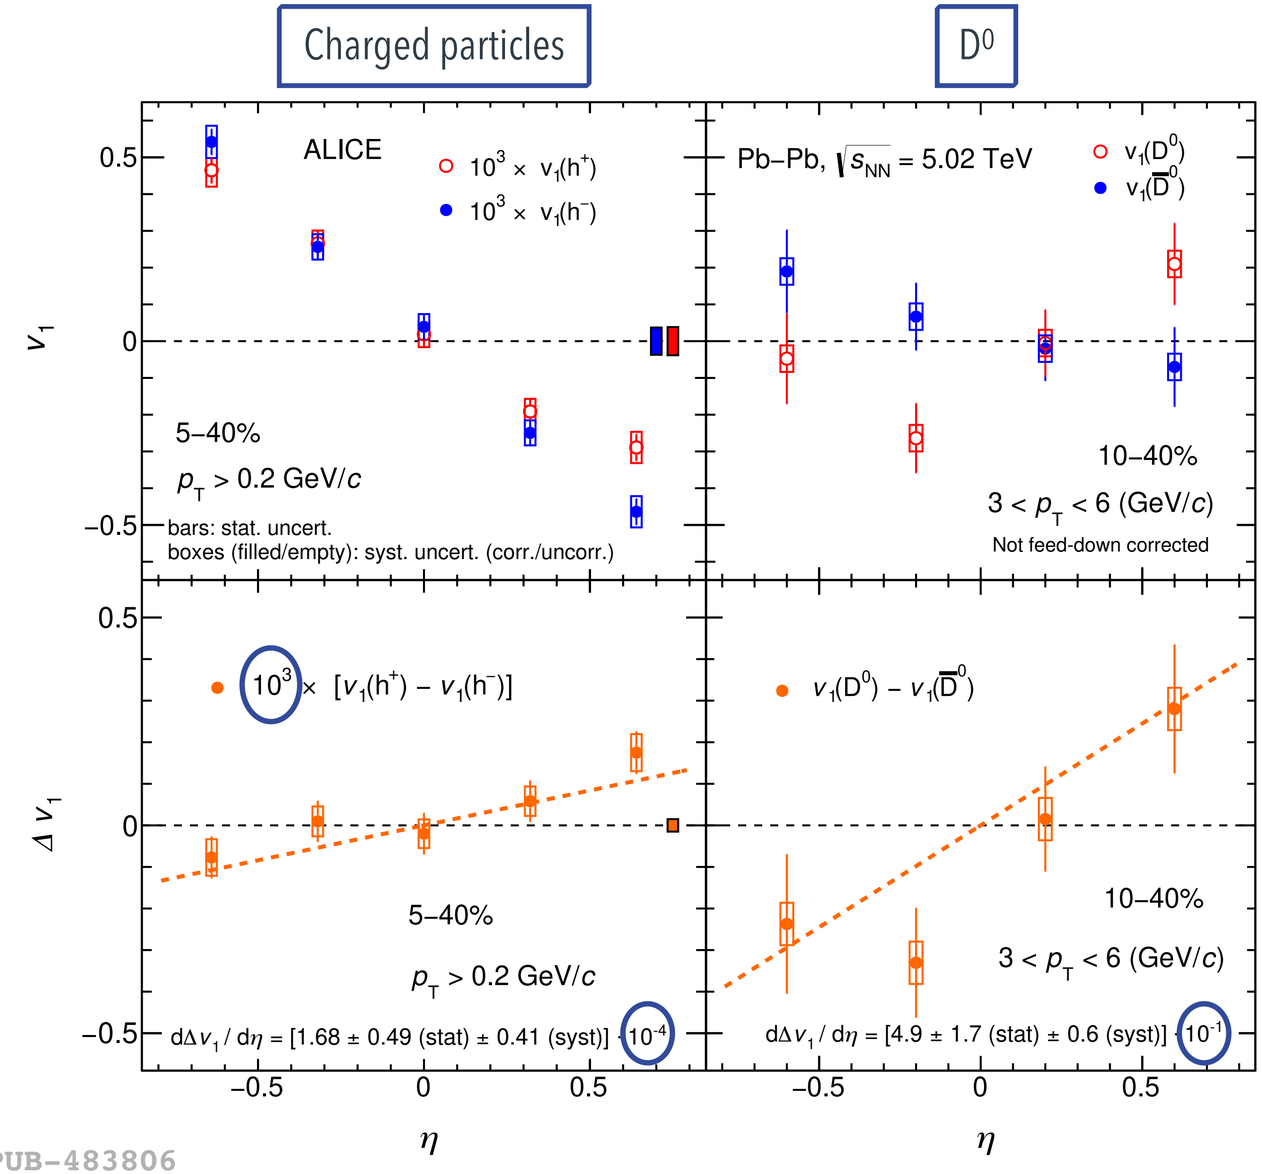
20% largest q_2^{TPC}

$\langle v_2 \rangle_{\text{large}-q_2} > \langle v_2 \rangle_{\text{unb}}$

POWLANG: EPJC (2019) 79:494
LIDO: PRC 98 (2018) 064901

Search for strong magnetic fields: charge-dependent D-meson v_1

F. Grosa (CERN)
fgrosa@cern.ch



ALI-PUB-483806

- Charm-quark production time comparable with maximum of magnetic field created in heavy-ion collisions
  - S. K. Das et al, PLB 768 (2017) 260-264
  - A. Beraudo et al, arXiv:2102.08064
  - ➡ Charge-dependent directed flow ideal observable to study early magnetic fields
- Indication of y-dependent charge difference
  - ➡ Different magnitude for charged particles and D⁰ mesons
  - ➡ 2.6σ significance for charged particles
  - ➡ 2.7σ significance for D⁰ mesons

ALICE D⁰: PRL 125 (2020) 022301

Υ(1S) elliptic flow vs. transport models

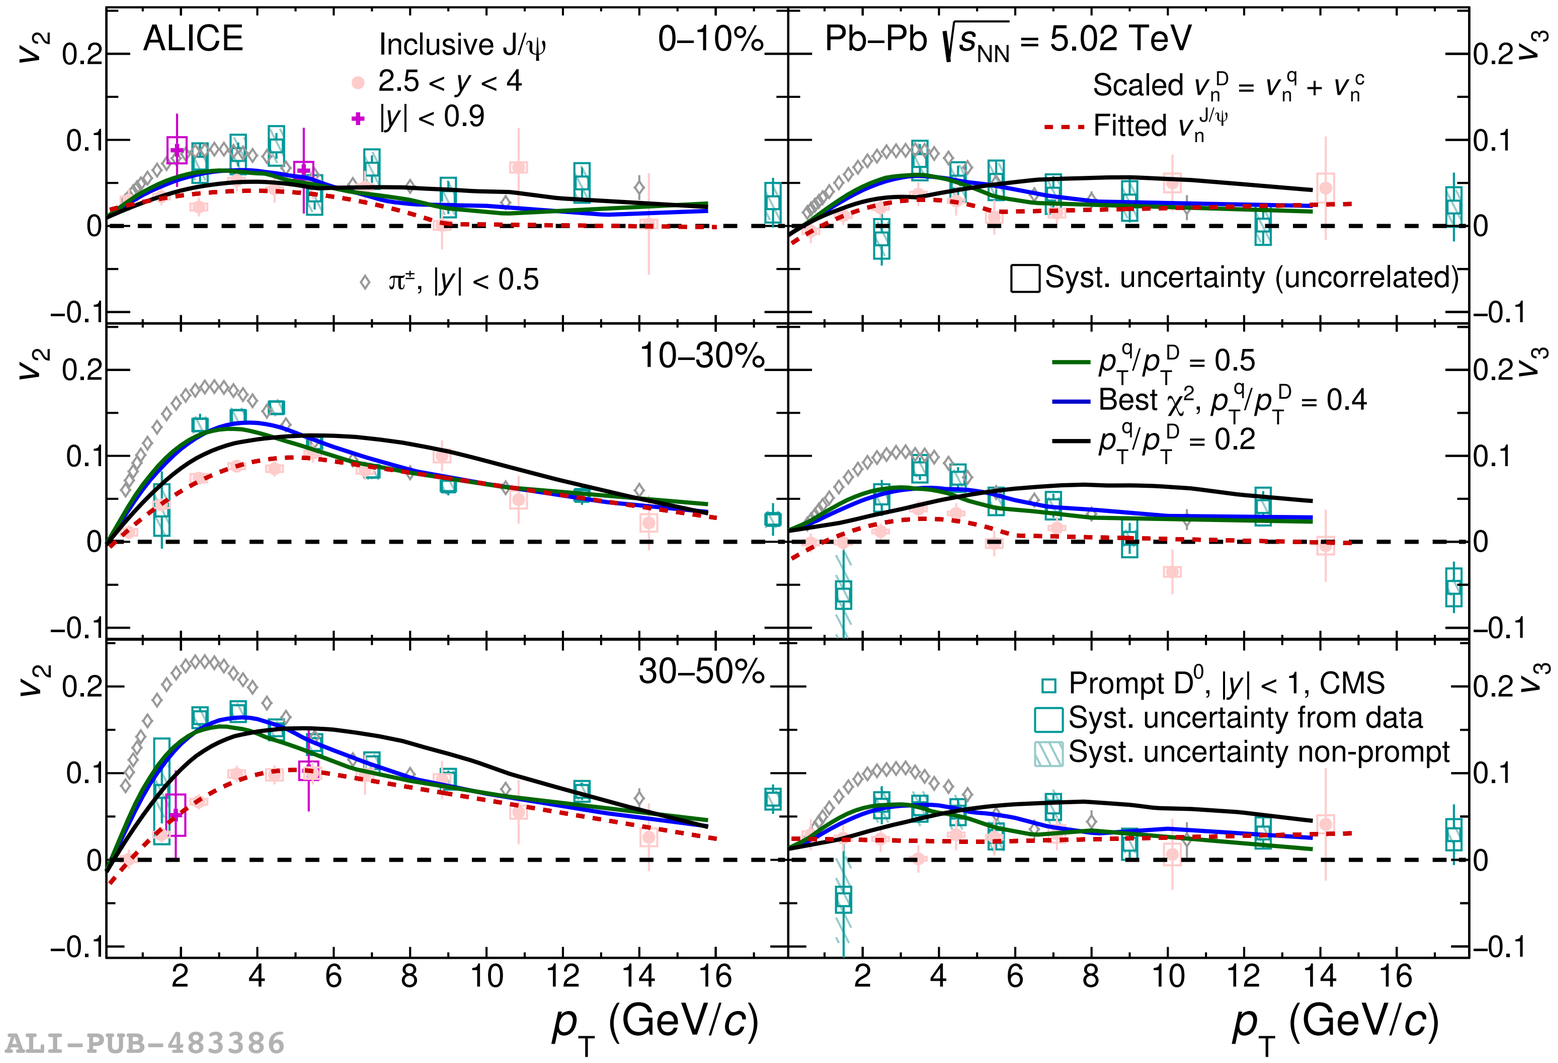
Hong, Lee: PLB 801 (2020) 135147

Scaling of v_2 with constituent quarks

F. Grosa (CERN)
fgrosa@cern.ch



ALI-PUB-483386

- v_n of D mesons can be obtained as a weighted average of the one of charm and light quarks:

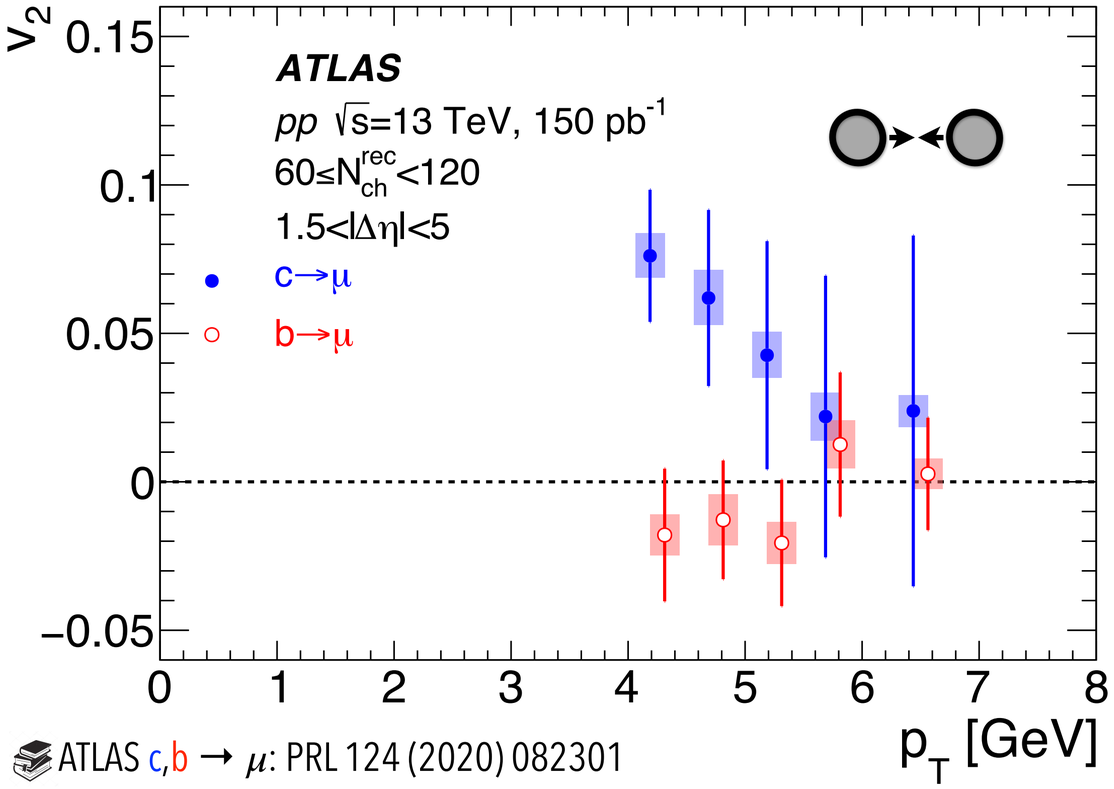
$$v_n^D(p_T^D) = v_n^q(p_T^q) + v_n^c(p_T^c)$$

  - ➡ Quark p_T and v_n obtained as half of those of charged pions and J/ψ mesons
  - ➡ Best agreement in case of $p_T^D/p_T^q = 0.4$

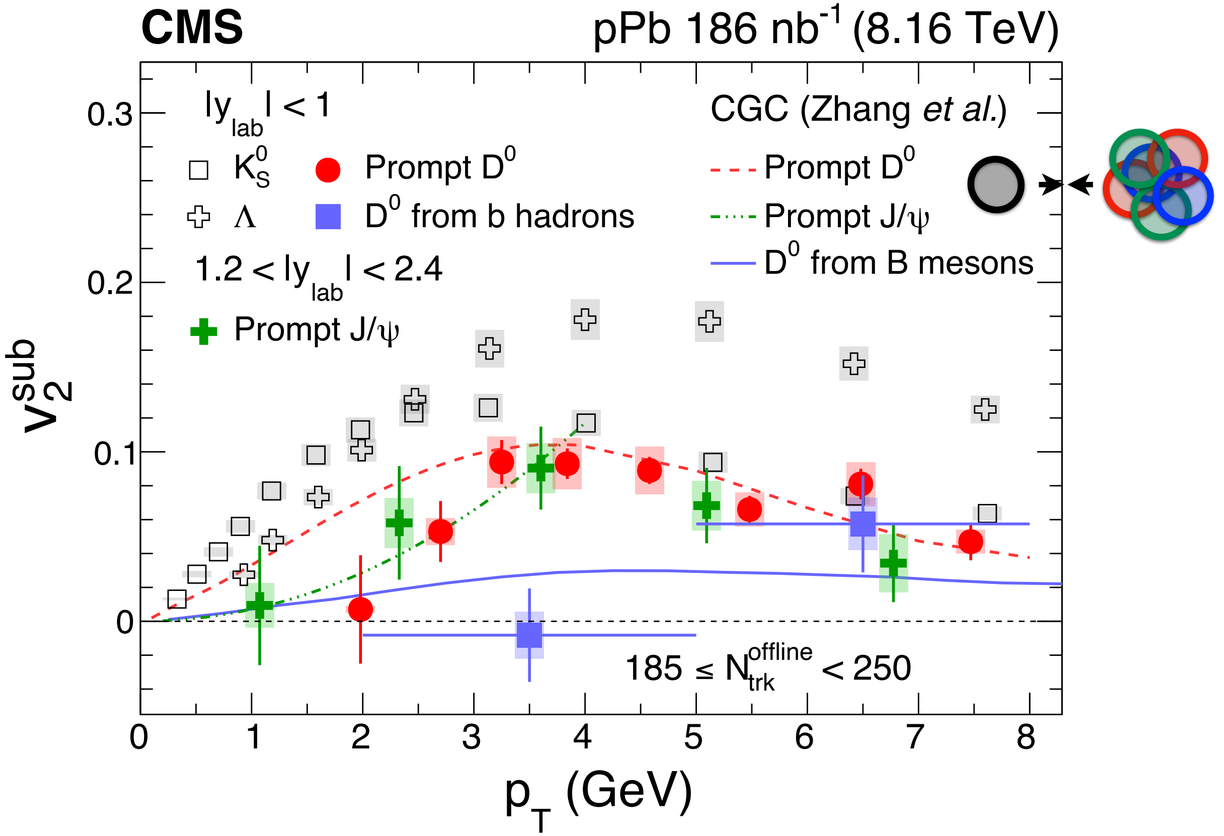
ALICE $\pi^{\pm}$: JHEP 09 (2018) 006
CMS prompt D⁰: PRL 120 (2018) 202301
ALICE J/ψ forward *y*: JHEP 10 (2020) 141
ALICE J/ψ mid *y*: JHEP 10 (2020) 141

Elliptic flow of open-beauty hadrons - small systems

F. Grosa (CERN)
fgrosa@cern.ch



ATLAS c,b → μ: PRL 124 (2020) 082301



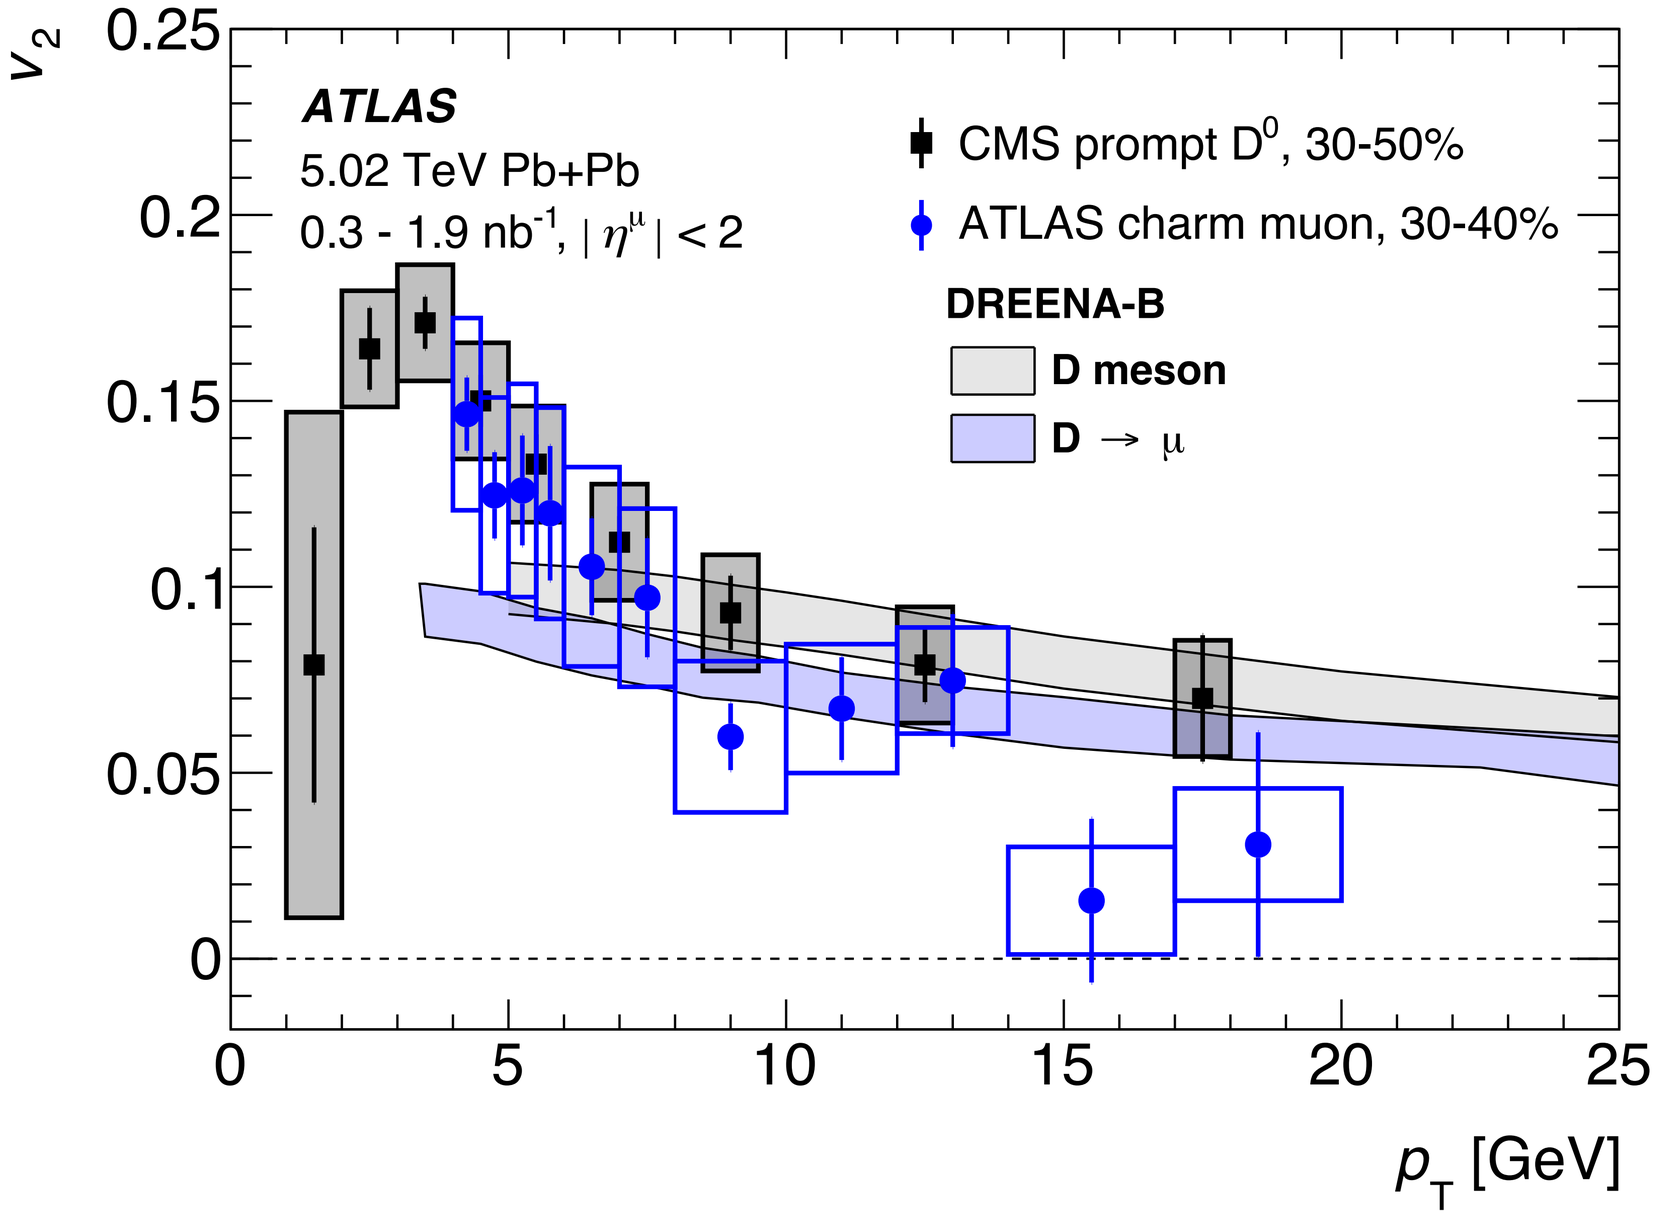
CMS c,b → D⁰, c→ J/ψ: PLB 813 (2021) 136036

ALICE J/ψ: PLB 780 (2018) 7-20

- No significant v_2 of muons (D⁰) from beauty-hadron decays in pp (pPb) collisions
  - ➡ Is it zero or just very small?
  - ➡ v_2 mainly driven by beauty-quark coalescence in heavy-ion collisions?
  - ➡ For more information about small systems see presentation by Georgios Krintiras on Wed June 9th at 16:00

D-meson vs. muons from D-meson decays

F. Grosa (CERN)
fgrosa@cern.ch



ATLAS c → μ: PLB 807 (2020) 135595

CMS prompt D^0: PRL 120 (2018) 202301
