# Motivation:

Figure: By Prof. Chun Shen

## Motivation:

Fluctuations of various physical quantities play a very important role in all fields of physics, as they reveal the information about

- possible phase transitions
- formation of structures in the Early Universe
- dissipative phenomena

Most common fluctuations we deal with are those arising from quantum uncertainty relation or those present in thermodynamic systems.

## Motivation:

- Space-time evolution of matter produced in relativistic heavy-ion collision is very well described by **relativistic (dissipative) hydrodynamics**.
- One of the concepts used in hydrodynamics are those of **energy density** and **pressure**, both are defined locally – formally, the fluid element has zero size.
- Successful hydro models are then used to conclude about the **energy density** attained in the collision processes, usually such values are very large.

## Basic concepts and definitions:

A **quantum field operator** for spin- $\frac{1}{2}$  particle has the standard form:

$$\psi(t, \mathbf{x}) = \sum_r \int \frac{d^3k}{(2\pi)^3 \sqrt{2\omega_{\mathbf{k}}}} \left( U_r(\mathbf{k}) a_r(\mathbf{k}) e^{-ik \cdot x} + V_r(\mathbf{k}) b_r^\dagger(\mathbf{k}) e^{ik \cdot x} \right),$$

where  $a_r(\mathbf{k})$  and  $b_r^\dagger(\mathbf{k})$  are annihilation and creation operators for particles and antiparticles, respectively, satisfying the canonical commutation relations  $\{a_r(\mathbf{k}), a_s^\dagger(\mathbf{k}')\} = (2\pi)^3 \delta_{rs} \delta^{(3)}(\mathbf{k} - \mathbf{k}')$  and  $\{b_r(\mathbf{k}), b_s^\dagger(\mathbf{k}')\} = (2\pi)^3 \delta_{rs} \delta^{(3)}(\mathbf{k} - \mathbf{k}')$ , whereas  $\omega_{\mathbf{k}} = \sqrt{\mathbf{k}^2 + m^2}$  is the energy of a particle.

## Basic concepts and definitions:

To perform **thermal averaging**, it is sufficient to know the expectation values of the products of two and four creation and/or annihilation operators

$$\begin{aligned}\langle a_r^\dagger(\mathbf{k}) a_s(\mathbf{k}') \rangle &= (2\pi)^3 \delta_{rs} \delta^{(3)}(\mathbf{k} - \mathbf{k}') f(\omega_{\mathbf{k}}), \\ \langle a_r^\dagger(\mathbf{k}) a_s^\dagger(\mathbf{k}') a_{r'}(\mathbf{p}) a_{s'}(\mathbf{p}') \rangle &= (2\pi)^6 \left( \delta_{rs'} \delta_{r's} \delta^{(3)}(\mathbf{k} - \mathbf{p}') \delta^{(3)}(\mathbf{k}' - \mathbf{p}) \right. \\ &\quad \left. - \delta_{rr'} \delta_{ss'} \delta^{(3)}(\mathbf{k} - \mathbf{p}) \delta^{(3)}(\mathbf{k}' - \mathbf{p}') \right) f(\omega_{\mathbf{k}}) f(\omega_{\mathbf{k}'}).\end{aligned}$$

Here  $f(\omega_{\mathbf{k}})$  is the Fermi–Dirac distribution function for particles.

## Basic concepts and definitions:

We define an operator  $\hat{T}_a^{00}$  that represents the energy density of a subsystem  $S_a$  placed at the origin of the coordinate system

$$\hat{T}_a^{00} = \frac{1}{(a\sqrt{\pi})^3} \int d^3\mathbf{x} \hat{T}^{00}(\mathbf{x}) \exp\left(-\frac{\mathbf{x}^2}{a^2}\right).$$

In above eq., a smooth Gaussian profile has been used to define the subsystem  $S_a$ .

To determine the fluctuation of the energy density of the subsystem  $S_a$ , we consider the variance

$$\sigma^2(a, m, T) = \langle : \hat{T}_a^{00} :: \hat{T}_a^{00} : \rangle - \langle : \hat{T}_a^{00} : \rangle^2$$

and the normalized standard deviation

$$\sigma_n(a, m, T) = \frac{(\langle : \hat{T}_a^{00} :: \hat{T}_a^{00} : \rangle - \langle : \hat{T}_a^{00} : \rangle^2)^{1/2}}{\langle : \hat{T}_a^{00} : \rangle}.$$

## Different forms of energy-momentum tensors:

For any original EM tensor  $\hat{T}^{\mu\nu}$  satisfying the continuity equation  $\partial_\mu \hat{T}^{\mu\nu} = 0$  we can construct a different one by adding the divergence of an antisymmetric object, namely

$$\hat{T}'^{\mu\nu} = \hat{T}^{\mu\nu} + \partial_\lambda \hat{A}^{\nu\mu\lambda}$$

with  $\hat{A}^{\nu\mu\lambda} = -\hat{A}^{\nu\lambda\mu}$ . By construction, the new tensor is also conserved, i.e.,  $\partial_\mu \hat{T}'^{\mu\nu} = 0$ .

- We aim here to study the dependence of quantum fluctuations of energy on the so-called pseudo-gauge transformation.

## Different forms of energy-momentum tensors:

Canonical energy-momentum tensor:

$$\hat{T}_{\text{Can}}^{\mu\nu} = \frac{i}{2} \bar{\psi} \gamma^\mu \overleftrightarrow{\partial}^\nu \psi.$$

Belinfante-Rosenfeld form:

$$\hat{T}_{\text{BR}}^{\mu\nu} = \frac{i}{2} \bar{\psi} \gamma^\mu \overleftrightarrow{\partial}^\nu \psi - \frac{i}{16} \partial_\lambda \left( \bar{\psi} \left\{ \gamma^\lambda, [\gamma^\mu, \gamma^\nu] \right\} \psi \right).$$

The de Groot-van Leeuwen-van Weert (GLW) form:

$$\hat{T}_{\text{GLW}}^{\mu\nu} = \frac{1}{4m} \left[ -\bar{\psi} (\partial^\mu \partial^\nu \psi) + (\partial^\mu \bar{\psi}) (\partial^\nu \psi) + (\partial^\nu \bar{\psi}) (\partial^\mu \psi) - (\partial^\mu \partial^\nu \bar{\psi}) \psi \right].$$

Hilgevoord-Wouthuysen form:

$$\hat{T}_{\text{HW}}^{\mu\nu} = \hat{T}_{\text{Can}}^{\mu\nu} + \frac{i}{2m} \left[ \partial^\nu \bar{\psi} \sigma^{\mu\beta} \partial_\beta \psi + \partial_\alpha \bar{\psi} \sigma^{\alpha\mu} \partial^\nu \psi \right] - \frac{ig^{\mu\nu}}{4m} \partial_\lambda \left( \bar{\psi} \sigma^{\lambda\alpha} \overleftrightarrow{\partial}_\alpha \psi \right)$$

## Energy densities and quantum fluctuation expressions:

Energy densities obtained for different pseudo-gauge choices are the same, i.e.,  $\varepsilon_{\text{Can}}(T) = \varepsilon_{\text{BR}}(T) = \varepsilon_{\text{GLW}}(T) = \varepsilon_{\text{HW}}(T)$ .

$$\langle : \hat{T}_{\text{Can},a}^{00} : \rangle = 4 \int \frac{d^3k}{(2\pi)^3} \omega_{\mathbf{k}} f(\omega_{\mathbf{k}}) \equiv \varepsilon_{\text{Can}}(T).$$

On the other hand, the fluctuations of  $: \hat{T}_a^{00} :$  are in general different for different pseudo-gauge choices.

# Comparison of normalized standard deviation for various pseudo-gauges:

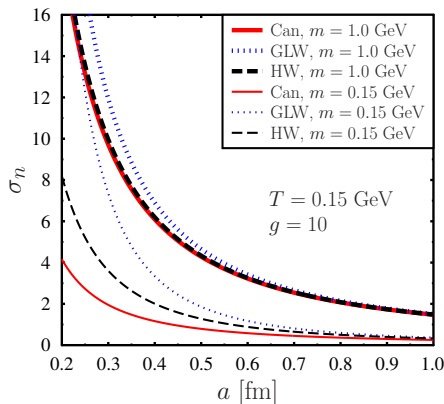

Figure: Comparison of normalized standard deviation for various pseudo-gauges for  $T = 0.15$  GeV,  $m = 1.0$  GeV (thick lines) and  $m = 0.15$  GeV (thin lines).

# Comparison of normalized standard deviation for various pseudo-gauges:

Figure: Comparison of normalized standard deviation for various pseudo-gauges for  $T = 0.5$  GeV and  $m = 0.01$  GeV.

## Variation of the normalized energy fluctuation:

Figure: Variation of the normalized energy fluctuation in the subsystem  $S_a$  with the length scale  $a$  for  $T = 0.15$  GeV and  $m = 1.0$  GeV.

## Variation of the normalized energy fluctuation:

Figure: Same as above but for  $T = m = 0.15$  GeV.

## Summary:

- Expressions for quantum fluctuations of energy density in subsystems of a hot relativistic gas of particles with spin  $\frac{1}{2}$  derived.
- They depend on the form of the energy-momentum tensor.
- For sufficiently large subsystems the results obtained in different pseudo-gauges converge and agree with the canonical-ensemble formula known from statistical physics.
- On the practical side, the results of our calculations can be used to determine a scale of coarse graining for which the choice of the pseudo-gauge becomes irrelevant, which may be useful, in particular, in the context of hydrodynamic modeling of high-energy collisions.

We are a product of  
quantum fluctuations in  
the very early universe.
