

Looking at New Physics using Visual recognition

7-12 June 2021

José Enrique García Navarro, María Moreno Llácer and Adrián Rubio Jiménez (speaker)

Visual recognition is based on **Convolutional Neural Networks** (CNNs)

How to codify the information of particle collisions in images?

For each object:

X-axis [-4.5,4.5]: **pseudorapidity** Y-axis [-pi, pi]: azimuthal angle Circle radius proportional to **transverse momentum** (non-linearly)

Much more underlying information:

- Angular distances between objects.
- Closest objects probably share a common origin (same parent decay).

Despite different ways to represent a collision in an image can be imagined, this one is a very intuitive way in which every object corresponds to a coloured circle

> We expect that CNNs can learn physics!!

signal. The background consists of W+jets, ttbar, t-channel and Wt single top (the latter three merged).

Q2: Could CNNs together with this image representation actually be used for event classification?

CNN trained from scratch

Thus, the *"feature extractor"* of VGG16 was already trained using the ImageNet dataset and only the "classifier" part has been tuned with our samples.

ImageNet

TRAINING

Random neural network

on ImageNet

It looks so! And transfer learning seems to be a suitable option

Transfer learning is based on the idea that a good profit can be made of the power of a wellperforming CNN with a previous training.

Deep CNN trained from scratch

A CNN with 11 layers has been built to train all its weights using our samples.

/GG16	16	16,3	8,7
CNN	Number of layers	Total parameters (x10 ⁶)	Trainable parameters (x10 ⁶)
x 1000			
r	Using transfer learning implies that not all the parameters will be trained.		
is			

Q3: How well this technique (based on CNNs and images) performs in **comparison to other techniques based on kinematic variables?**

Advantages

No previous feature study is required, since most important information is in the images and "the CNN decides where to see".

This image representation makes the event information more intuitive also for humans.

Unlimited creativity can be applied for including additional features to the images.

Disadvantages

Creating these images introduces an additional step in the analysis chain, which is not required when using other techniques.

Study the features that the CNNs are learning is quite tedious, but still possible looking into intermediate layers.

Adding a new feature is not always as straightforward as adding a new "variable column".
