A model independent probe for Elusive Dark Sectors at Future Experiments

SONALI VERMA

Work in Progress with R. K. Mishra, M. Costa

INFN Istituto Nazionale di Fisica Nucleare

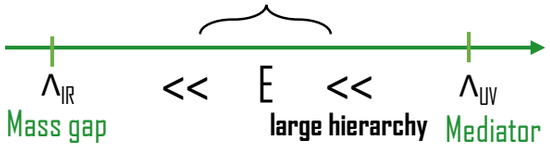
SCUOLA NORMALE SUPERIORE

Goal

Derive **model independent bounds** on SM-neutral and light dark sectors coupled to the visible sector via irrelevant portal interactions [1] from **future experiments dedicated to long lived particle (LLP) searches**.

Elusive Dark Sector (DS)

theory is **approx. conformal**



At $\Lambda_{UV} << E << \Lambda_{IR}$ → use **CFT** (conformal field theory) composite operators for DS !

$$\mathcal{L}_{\rm portal} = \underbrace{\mathcal{O}_{\rm CFT}}_{\mathcal{O},\, J_\mu^{DS},\, T_{\mu\nu}^{DS}} \times \underbrace{\mathcal{O}_{\rm SM}}_{H^\dagger H,\, \bar\psi\gamma^\mu\psi,\, \ldots} \Rightarrow \text{Dim}[O_{DS}\, O_{SM}] > 4$$

$\text{dim}[O_{SM}] \leq 4$

Minimal lagrangian

$$\mathcal{L}_{\rm portal} = \frac{\kappa_{\mathcal{O}}}{\Lambda_{\rm UV}^{\Delta_{\mathcal{O}}-2}} \mathcal{O}\, H^\dagger H + \frac{\kappa_J}{\Lambda_{\rm UV}^2} J_\mu^{DS} J_{SM}^\mu + \frac{\kappa_T}{\Lambda_{\rm UV}^4} T_{DS}^{\mu\nu} O_{\mu\nu}^{SM}$$

Dimless coefficients : $\kappa_{\mathcal{O}}, \kappa_J, \kappa_T$

Benchmark Models:

- Pure Yang Mills Dark Sector ,
- theory with free fermions and
- 5 D Randall Sundrum Dark Sectors

Dark Sector Production

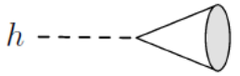
At $\Lambda_{\rm IR} \ll \sqrt{\hat{s}} \ll \Lambda_{\rm UV}$ **DS inclusive production** approximated by considering contributions only from conformal regime and using optical theorem:

$$\sum_n \int d\Phi_{DS} |\langle 0|O_{DS}|n\rangle|^2 = 2\,\text{Im}\,[i\langle 0|T\{O_{DS}O_{DS}\}|0\rangle]$$

operator interpolating DS state n from vacuum.

For higgs production ($\Lambda_{\rm IR} < m_{\rm higgs}$):

$$\Gamma_{h\to DS} = -\frac{1}{m_h}\frac{\kappa_{\mathcal{O}}^2 v^2}{\Lambda_{\rm UV}^{2\Delta_{\mathcal{O}}-4}} \underbrace{\text{Im}\; i\,\langle \mathcal{O}(-p)\mathcal{O}(p)\rangle\,|_{p^2=m_h^2}}_{\text{CFT 2 point correlation function}} .$$



$$\frac{c_{\mathcal{O}}}{\pi^{3/2}}\frac{\Gamma(\Delta_{\mathcal{O}}+1/2)}{\Gamma(\Delta_{\mathcal{O}}-1)\Gamma(2\Delta_{\mathcal{O}})}(p^2)^{\Delta_{\mathcal{O}}-2}$$

Lifetime of Lightest DS Particle

When probed at energies >> $\Lambda_{\rm IR}$ $\mathcal{O}_{\rm DS}$ excites CFT states with DS d.o.f.s
Strongly coupled # d.o.f.s > Weakly coupled # d.o.f.s

All DS decays to LDSP (ψ) which decays back to SM via portal of dim D.

- $m_\psi > m_{\rm EW}$ $\quad \tau_\psi \sim \left[\Lambda_{\rm IR}\frac{\kappa^2}{8\pi}\left(\frac{f^2}{\Lambda_{\rm IR}^2}\right)\left(\frac{\Lambda_{\rm IR}^2}{\Lambda_{\rm UV}^2}\right)^{D-4}\right]^{-1}$ decay constant

- $m_\psi < m_{\rm EW}$ $\quad \tau_\psi = (\Gamma_h(m_\psi)\sin^2\theta_h)^{-1}$,

$$\langle 0|\mathcal{O}|\psi\rangle = \hat{A}\, f\, \Lambda_{\rm IR}^{\Delta-2}$$

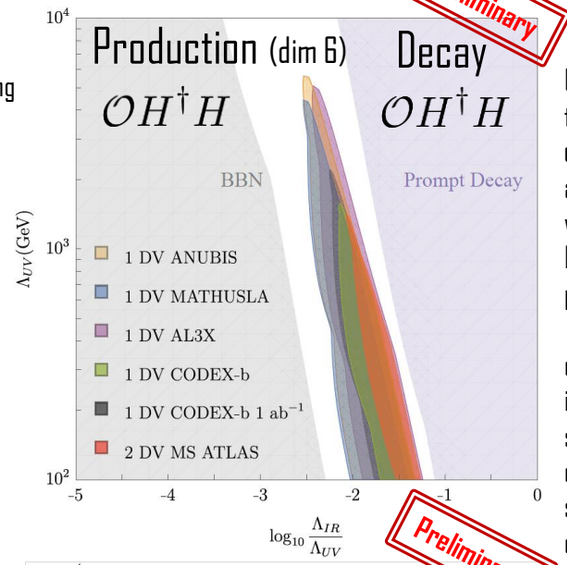
mixing angle

$$\tan 2\theta_h = \frac{2\delta_h}{m_\psi^2 - m_h^2},$$

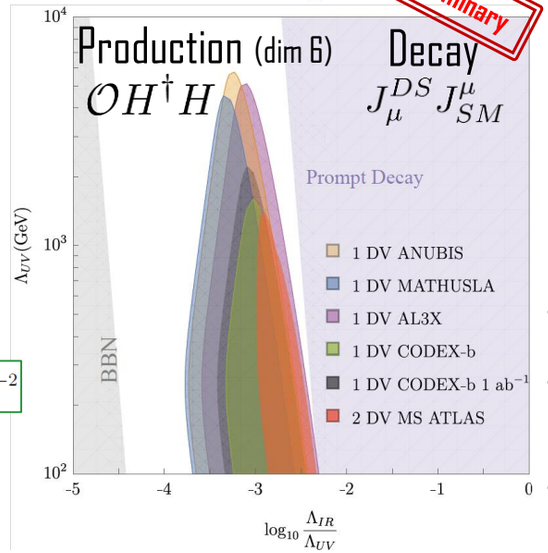
mass mixing term

$$\delta_h = \kappa_{\mathcal{O}} v f \left(\frac{\Lambda_{\rm IR}}{\Lambda_{UV}}\right)^{\Delta-2}$$

Preliminary



Preliminary



Results

Constraints on resonant DS production through D=6 higgs portal coming from **displaced vertices (DV)** searches. Plots assume **weakly coupled** dark dynamics where no. of LDSPs =2.. The decay of LDSP is shown for two different types of portal: *(top left)* same **D=6 higgs portal,** *(bottom left)* **generic D=6 portal.** The orange contour shows our model independent bounds from current 2 DV searches in ATLAS [2][3] and in comparison are shown contours for 1 DV searches in future proposed LLP experiments: ANUBIS, MATHUSLA, AL3X, CODEX-b. The shaded gray region is excluded due to bounds from Big Bang Nucleosynthesis (BBN) since $\tau_{LDSP} < 1\ s$. The purple shaded region shows region excluded by prompt decays which are model dependent.

Conclusions

- Dark sectors coupled to SM via irrelevant portals are very elusive.
- Current Collider searches barely probe the parameter space for such sectors.
- Future experiments will be powerful probes for such sectors.
