

CMS's Position

CMSSW uses `tbb::task` directly but not its advanced features

Need to be able to pass an encapsulation of a task to a function

Need to be able to launch the encapsulated task in a non-blocking way

Will explore using other TBB interfaces for our needs

Will look at `tbb::task_group` first

Plan to modify our prototype-framework to test the API change

Will feedback any breaking problems found to the Intel developers

At this early stage, we do not expect any changes for Run 3

If can remove `tbb::task` API in a non-disruptive way we will

If not will just live with deprecation warnings

At worse can use an older version of TBB or do a fork of the git repository
