Where we are with the Dark Energy Spectroscopic Instrument ?

Monday 5 September 2022 11:20 (20 minutes)

The Dark Energy Spectroscopic Instrument is a fourth generation dark energy experiment which will revolutionate the cosmological constraints that we can extract from the large scale structure of the universe. DESI started to take data in 2020, and now it just finished the September this first year of data. In this talk, I will summarize the survey, present the status of the experiment and give some highlights of the analysis being performed right now with the data collected, the simulations and the preparation of the analysis.
