

# *The 17th Workshop of the LHC Higgs Working Group*

## *NMSSM Subgroup Updates*

M. Margarete Mühlleitner (KIT)

Conveners:

ATLAS: Nikolaos Rompotis

CMS: Janek Bechtel

T: Ulrich Ellwanger, MM, Nausheen Shah

# Topics

Precision Physics

Phenomenology

Future Plans

# *Precision Physics*

# Spectrum Calculations

- Next-to-MSSM (NMSSM): 2 complex Higgs doublets plus complex singlet field
- Enlarged Higgs and neutralino sector:

7 Higgs bosons:  $H_1, H_2, H_3, A_1, A_2, H^+, H^-$   
5 neutralinos:  $\tilde{\chi}_i^0$  ( $i = 1, \dots, 5$ )

also used conventions:  
 $h_{125}, H, h, A, a$   
or  
 $h_{\text{SM}}, H, h_{\text{S}}, A, a_{\text{S}}$

- MSSM and NMSSM masses computed from input parameters: predictive power of the MSSM, NMSSM and other extensions  $\rightarrow$  important experimental test to be passed

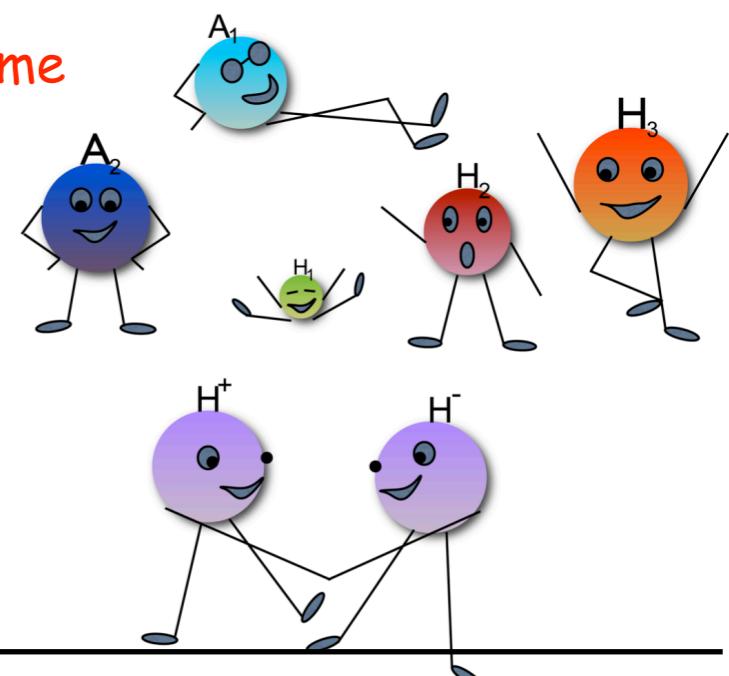

## ❖ Status MSSM spectrum calculations:

FO: up to 2-loop in on-shell (OS) and DR scheme, partial 3-loop in DR scheme

EFT: up to  $N^2LL$  (included in calculators),  $N^3LL$  (recently [Harlander et al.'18])

## ❖ Status NMSSM spectrum calculations:

up to 2-loop in mixed OS-DR scheme and in DR-scheme

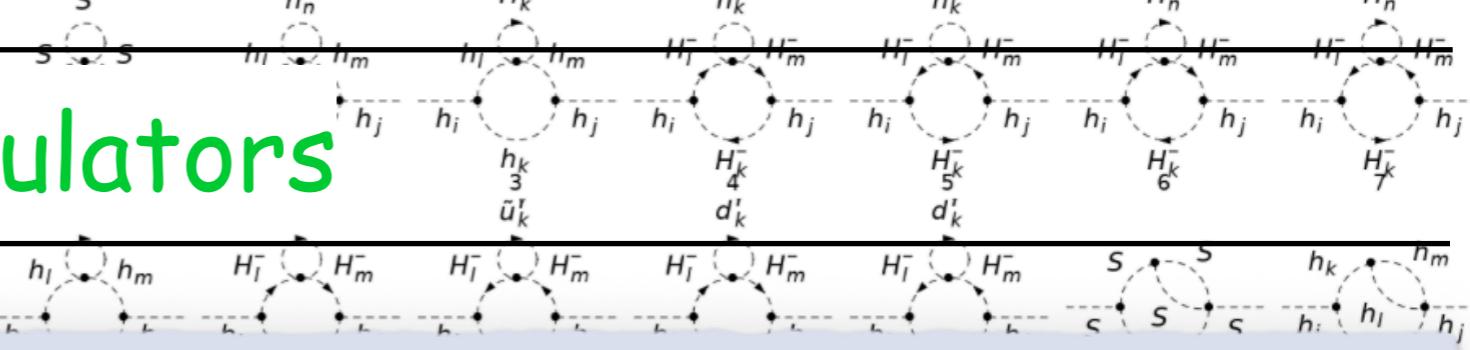

taken from  
 [Staub,Athron,  
 Ellwanger,Gröber,  
 MM,Slavich,  
 Voigt,'15]

# NMSSM Spectrum Calculators

## Remarks:

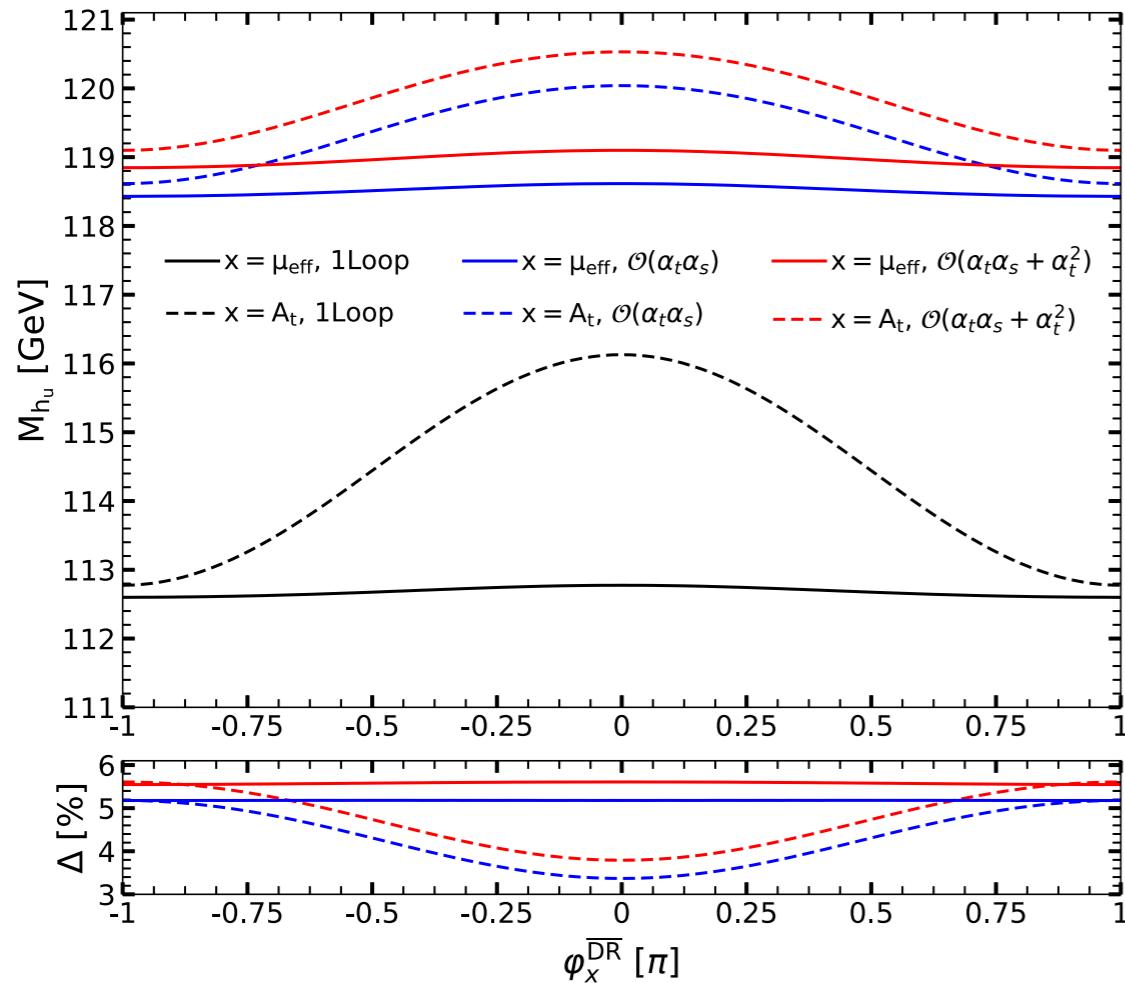

- comparison of codes in DR scheme: [Staub,Athron,Ellwanger,Gröber,MM,Slavich,Voigt,'15]  
FlexibleSUSY,NMSSMCALC,NMSSMTools, SOFTSUSY,SPheno
- comparison of codes in mixed OS-DR scheme: [Drechsel,Gröber,Heinemeyer,MM,Rzehak,Weiglein,'16]  
FeynHiggs, NMSSMCALC
- advances in FeynHiggs: [Drechsel,Galeta,Heinemeyer,Hollik,Liebler,Moortgat-Pick,Paßehr,Weiglein]  
real&complex NMSSM, GNMSSM: 1-loop in, 2-loop&resummation of HO log-effects only in  
MSSM limit, no public code yet
- solution of Goldstone boson catastrophe [Braathen,Goodsell,'16], [Braathen,Goodsell,Staub,'17]
- OS masses CP-violating NMSSM, consistent description production/decay [Domingo,Drechsel,Paßehr,'17]

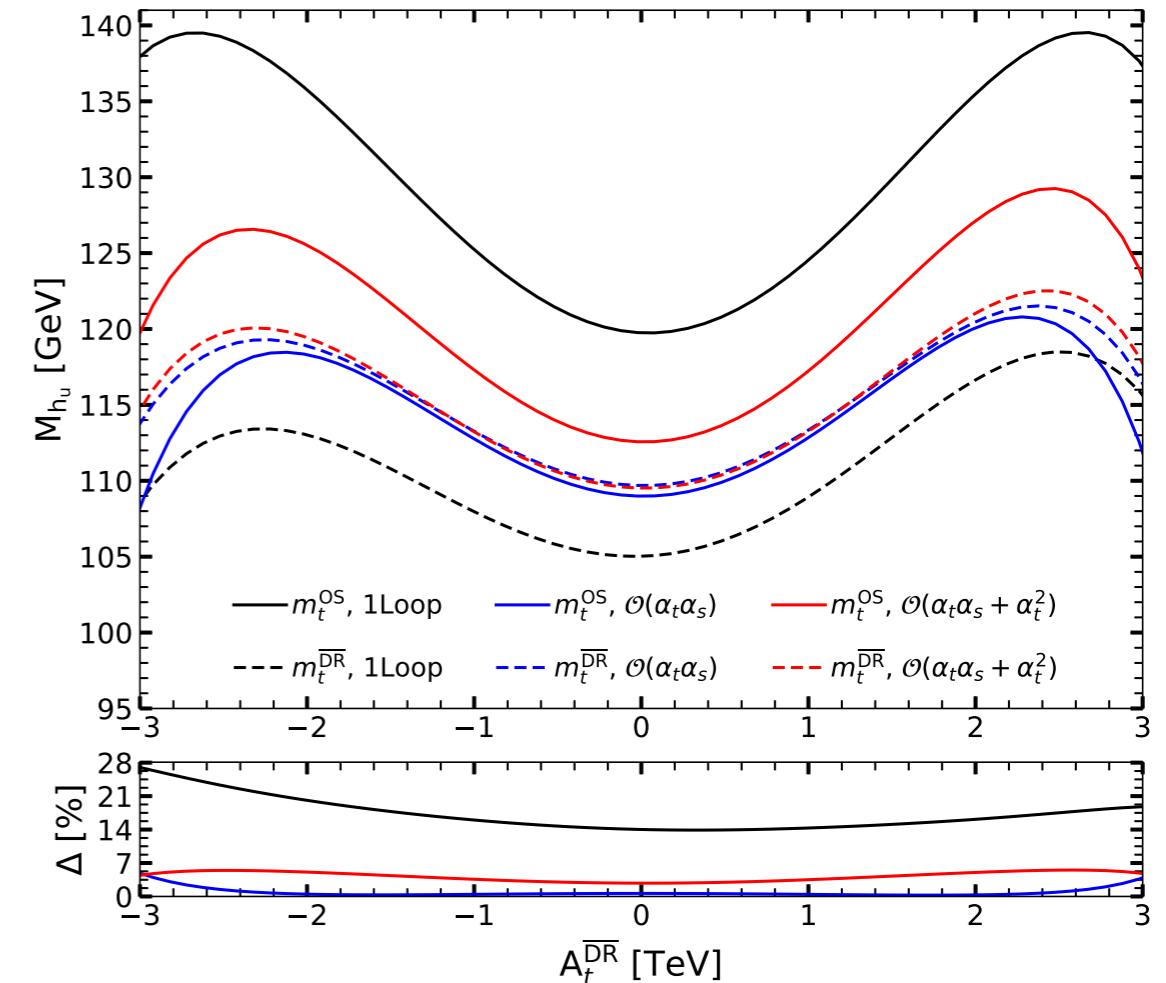

# Results for $\mathcal{O}(\alpha_t^2)$ Corrections

[Dao, Gröber, Krause, MM, Rzehak, JHEP08 (2019) 114]

Size of relative corrections

Renormalization scheme dependence

\* tree-level CP-violating phase kept zero

\*  $\Delta = \frac{|M_{h_u}^{(2,x)} - M_{h_u}^{(1)}|}{M_{h_u}^{(1)}}$  and  $x = \mathcal{O}(\alpha_t \alpha_s), \mathcal{O}(\alpha_t \alpha_s + \alpha_t^2)$

$$* \Delta = \frac{|M_{h_u}^{m_t(\overline{\text{DR}})} - M_{h_u}^{m_t(\text{OS})}|}{M_{h_u}^{m_t(\overline{\text{DR}})}}$$

# NMSSM (& Generic) Decay Calculators

- SoftSUSY [Allanach,Athron,Bednyakov,Tunstall,Voig,RuizdeAustri,Williams]: **MSSM & NMSSM**; 1->2 tree-level Higgs into {Higgs/sparticles/SM} particles and Sparticles into {Higgs},  $h \rightarrow Vff$  at tree level, MSSM/NMSSM Higgs  $\rightarrow gg,qq$  at NLO QCD, MSSM  $\rightarrow \gamma\gamma,Z\gamma$  at NLO QCD
- NMSSMCALC [Baglio,Gröber,MM,Nhung,Rzehak,Spira,Streicher,Walz]: **CP-conserving and CP-violating NMSSM** state-of-the-art HO QCD corrections from latest HDECAY version,  $\Delta_b, \Delta_s, \Delta_\tau$  corrections b, $\tau,s$  final states, all relevant off-shell into WW/ZZ,ZH<sub>i</sub>,WH<sup>+</sup>,H<sub>i</sub>H<sub>j</sub>,tt; also effective couplings output; new: **NMSSMCALCEW** [Baglio,Dao,MM,'19], see next slide
- NMSSMTools [Ellwanger,Hugonie]: **NMSSM**; HO QCD corrections à la HDECAY, but no 3-body decays, new: updated QCD corrections to H->gg from HDECAY [1801.09506]; constraints on reduced Higgs couplings in κ framework from ATLAS [1909.02845] CMS [1809.10733]; checks for DM relic density and regularly updated constraints on DM direct detection using MicrOmegas; computes also sparticle decays through generalization of SDECAY (MSSM) to NMSSM
- SloopS [Baro,Boudjema,Semenov]: **MSSM, NMSSM w/ complete one-loop corrections**; renormalisation in non-linear gauge fixing; different renormalisation schemes; different tanβ definitions
- SARAH/SPheno [Goodsell,Liebler,Staub]: fully **generic implementation** of 2-body decay widths of fermions and scalars at full 1L, see [1703.09237] for details

# Recent Developments

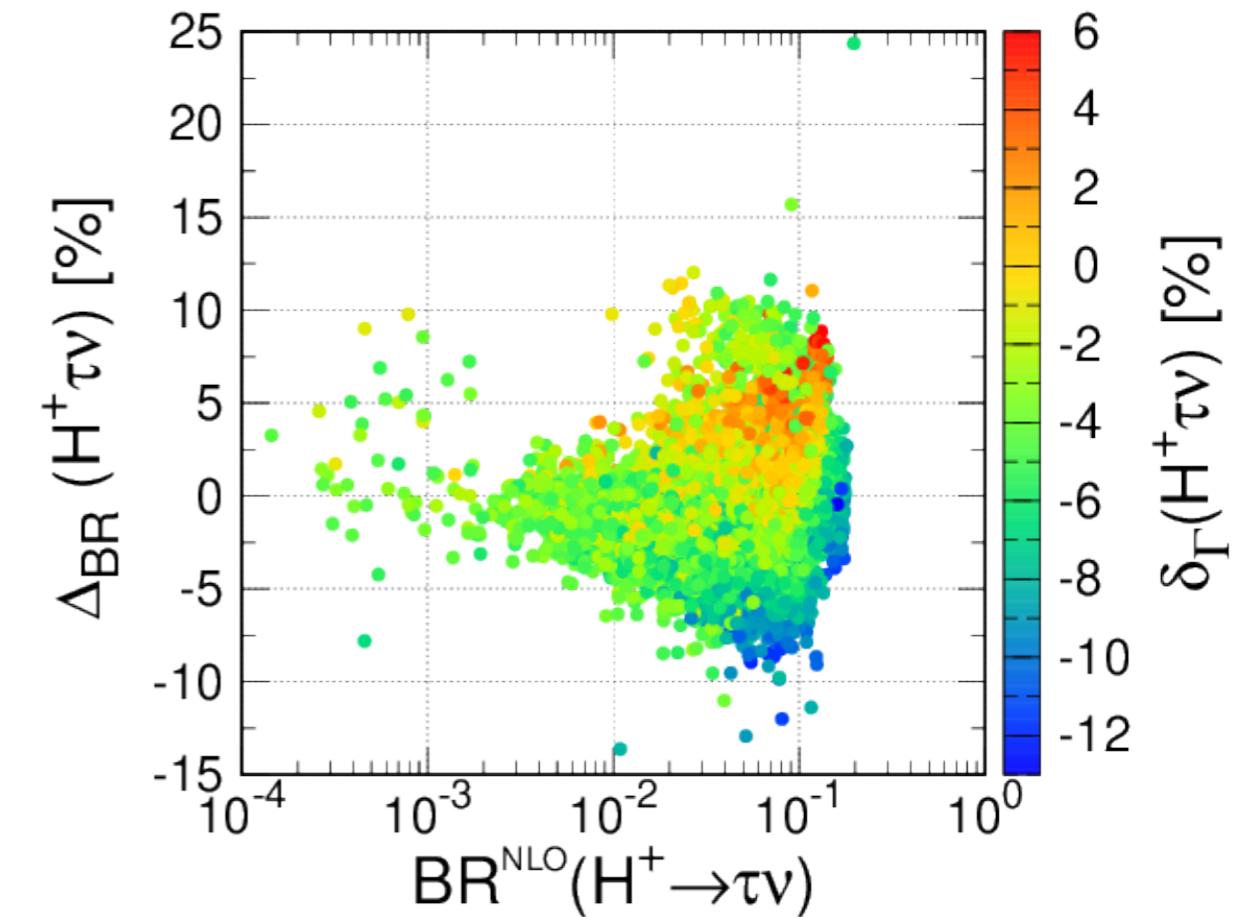

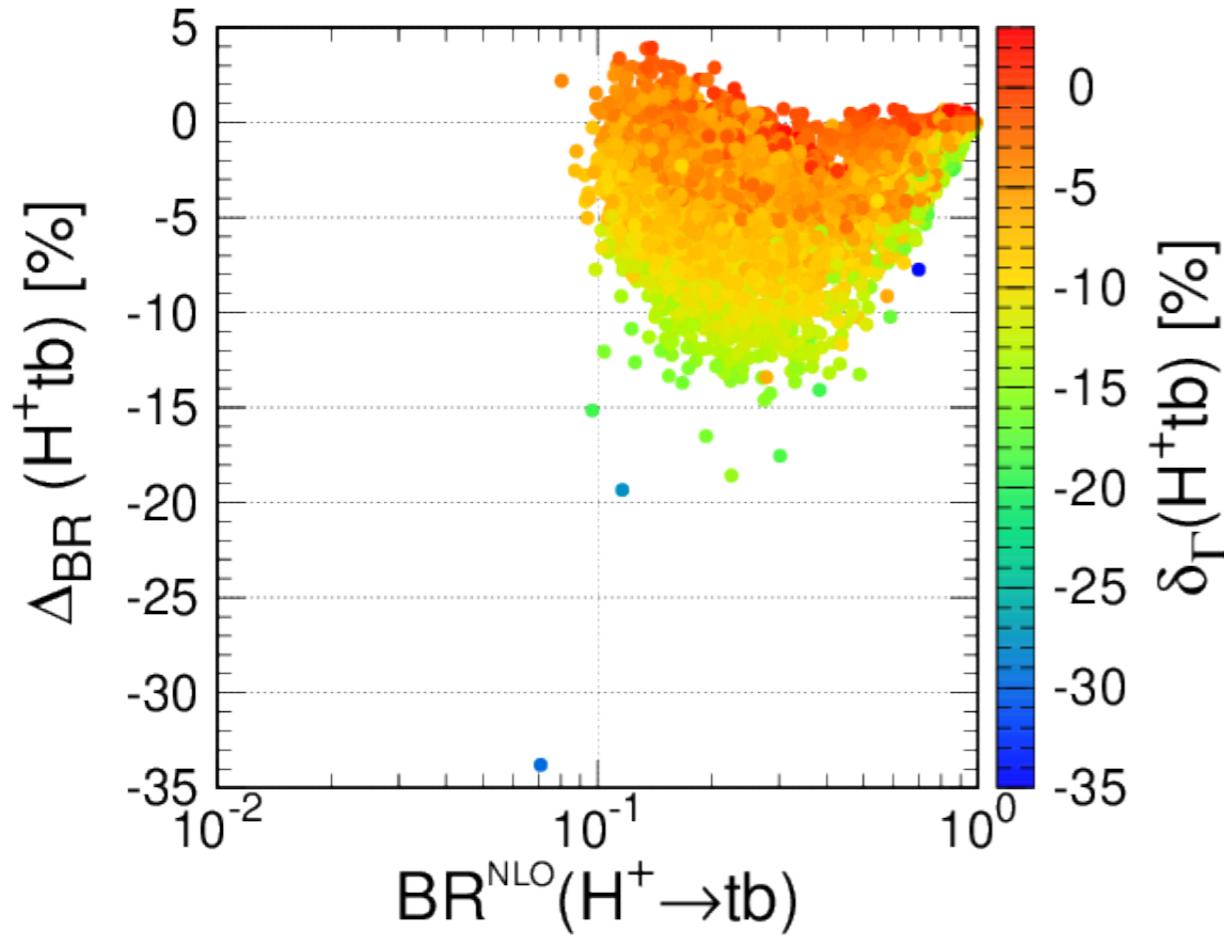

## Remarks:

- Full 1L to NMSSM Higgs decays in fermions and gauge bosons [Domingo,Paßehr,Weiglein, '18]
- EW corrections - effects on heavy NMSSM Higgs fermionic decays [Domingo,Paßehr, '19]
- Gauge dependence in 1L to  $H^+ \rightarrow W^+ H_i$  in NMSSM [Dao,Fritz,Krause,MM,Patel, '19]
- Investigation of possible solutions for the gauge-parameter violating problem in Higgs decays w/ (N)MSSM Higgs mixing effects [Domingo Paßehr, '20]
- NMSSMCALCEW: [Baglio,Dao,MM, '19]  
EW, SUSY-EW and SUSY-QCD corrections to neutral Higgs decays in the CP-conserving and CP-violating NMSSM consistently combined w/ QCD and  $\Delta b$ ; one-loop corrections to the electroweakino, stop and sbottom masses included in OS and DR scheme

# NEW: NMSSMCALCEW H<sup>+</sup> Decays

Preliminary

[Dao,MM,Patel,Sakurai]

$$\Delta_{\text{BR}}(H^\pm XX) = \frac{\text{BR}^{\text{NLO}}(H^\pm \rightarrow XX) - \text{BR}^{\text{LO}}(H^\pm \rightarrow XX)}{\max(\text{BR}^{\text{NLO}}(H^\pm \rightarrow XX), \text{BR}^{\text{LO}}(H^\pm \rightarrow XX))}$$

$$\delta_{\Gamma}(H^\pm X_i X_j) = \frac{\Gamma(H^\pm \rightarrow X_i X_j)^{\text{NLO}}}{\Gamma(H^\pm \rightarrow X_i X_j)^{\text{LO}}} - 1$$

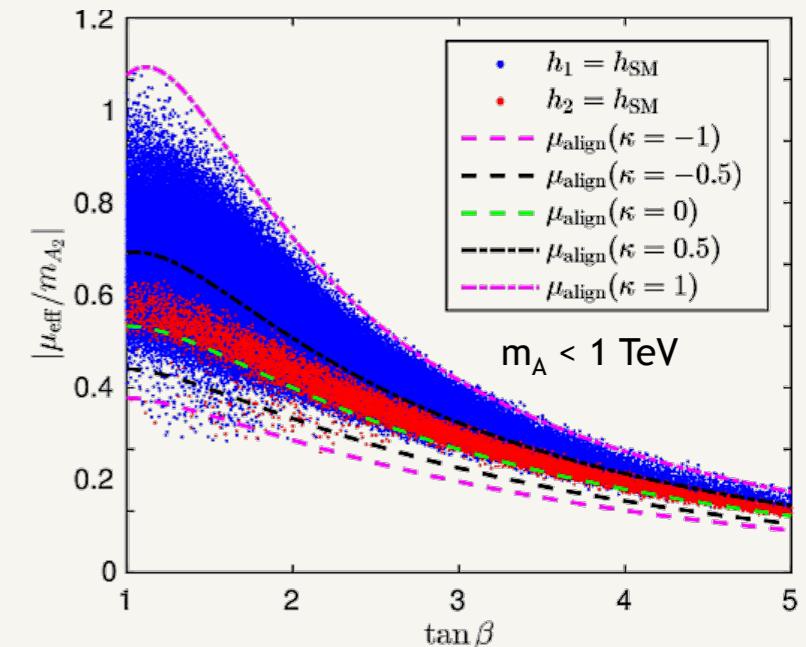

*Phenomenology*

NMSSM SM-like h :  
125

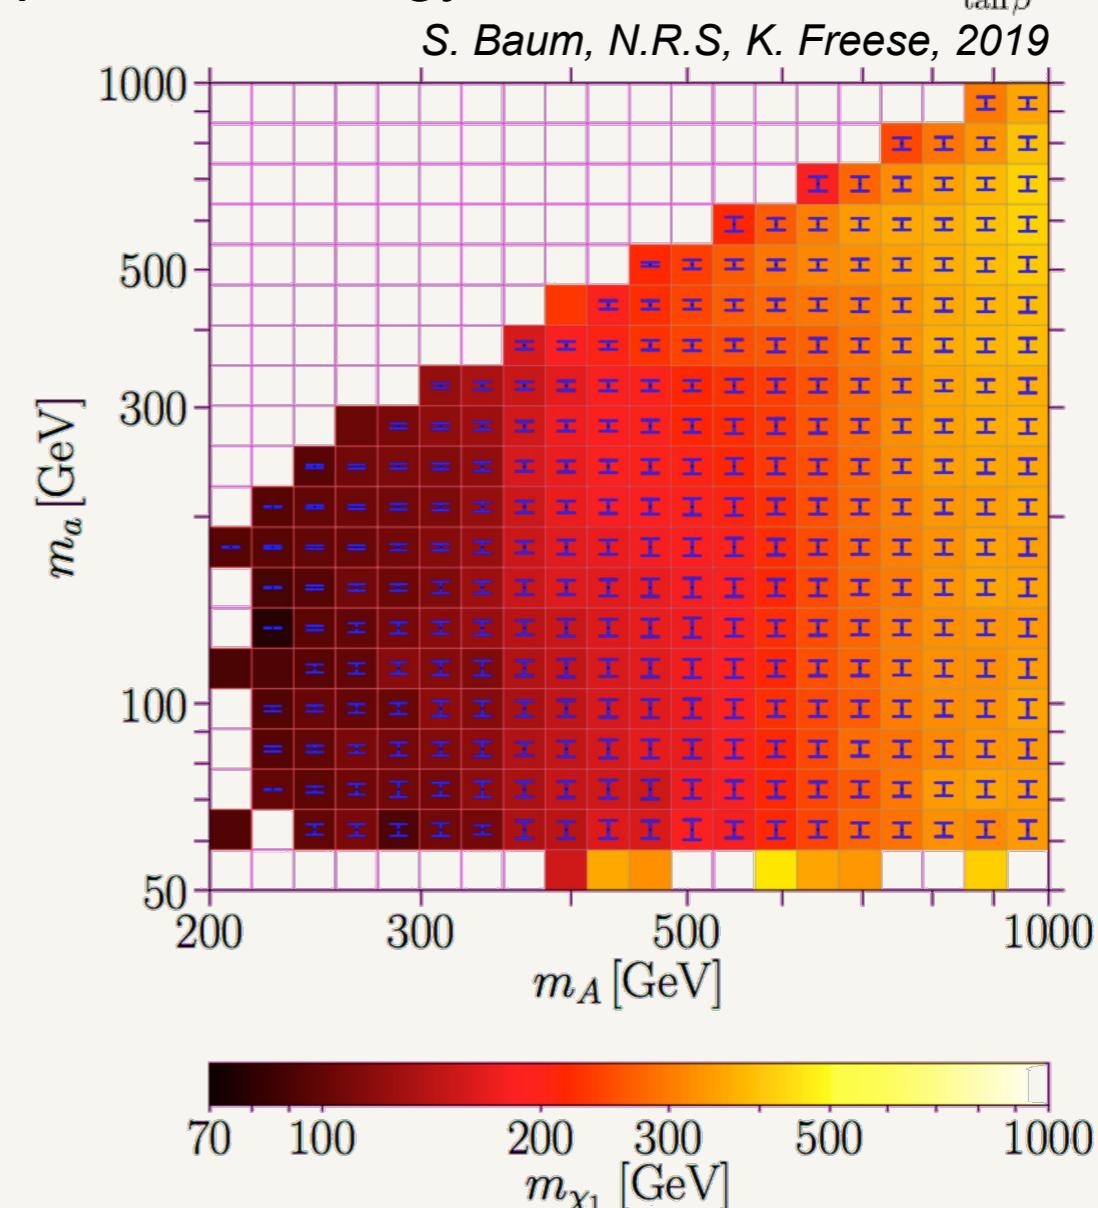

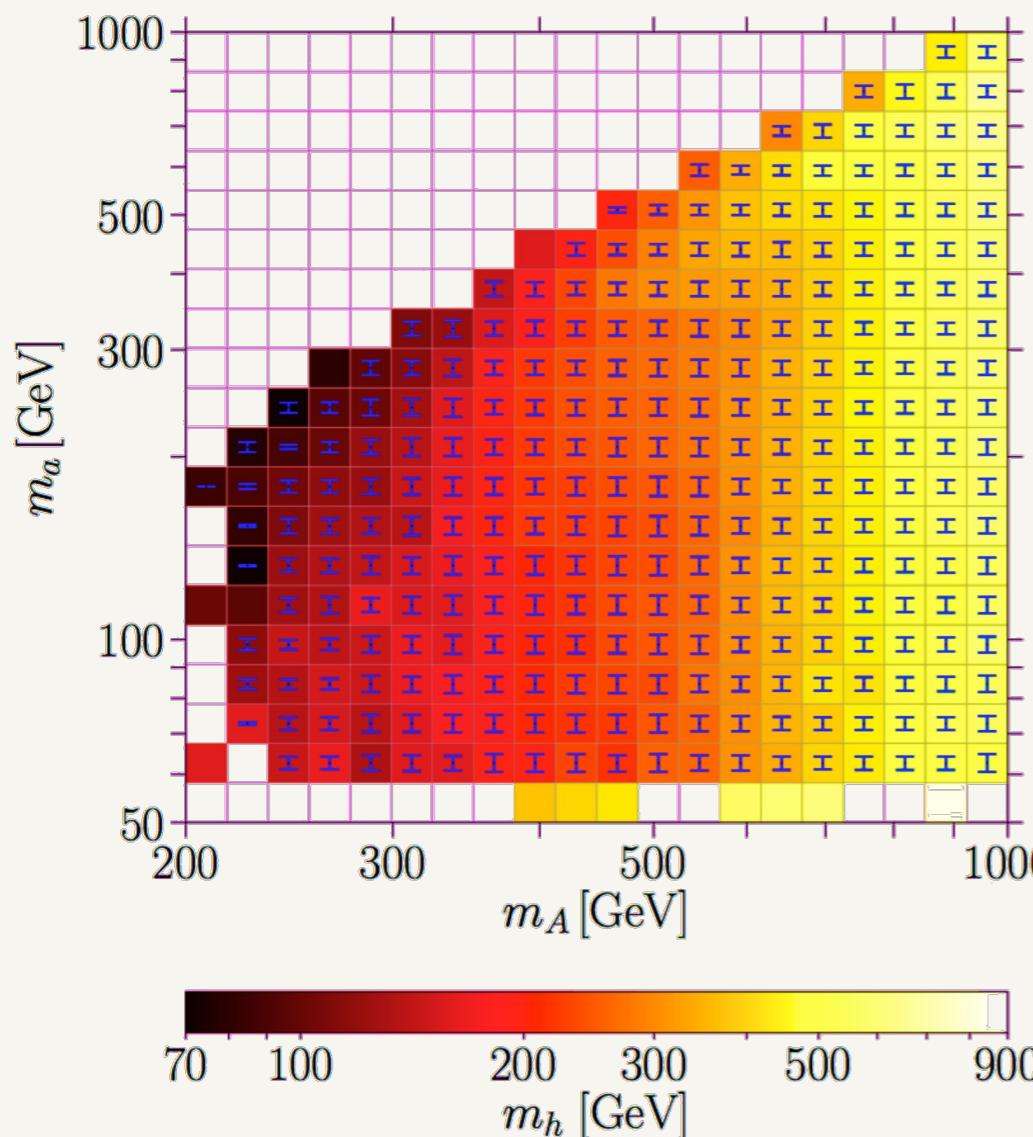

$$\lambda_{\text{alt}}^2 = \frac{m_h^2 - M_Z^2 c_{2\beta}}{v^2 s_\beta^2}$$

M. Carena, H. Haber, I. Low, NRS & C. Wagner, 2015

$$1 - \frac{m_A^2}{4\mu^2} s_{2\beta}^2 - \frac{\kappa}{2\lambda} s_{2\beta} = 0$$

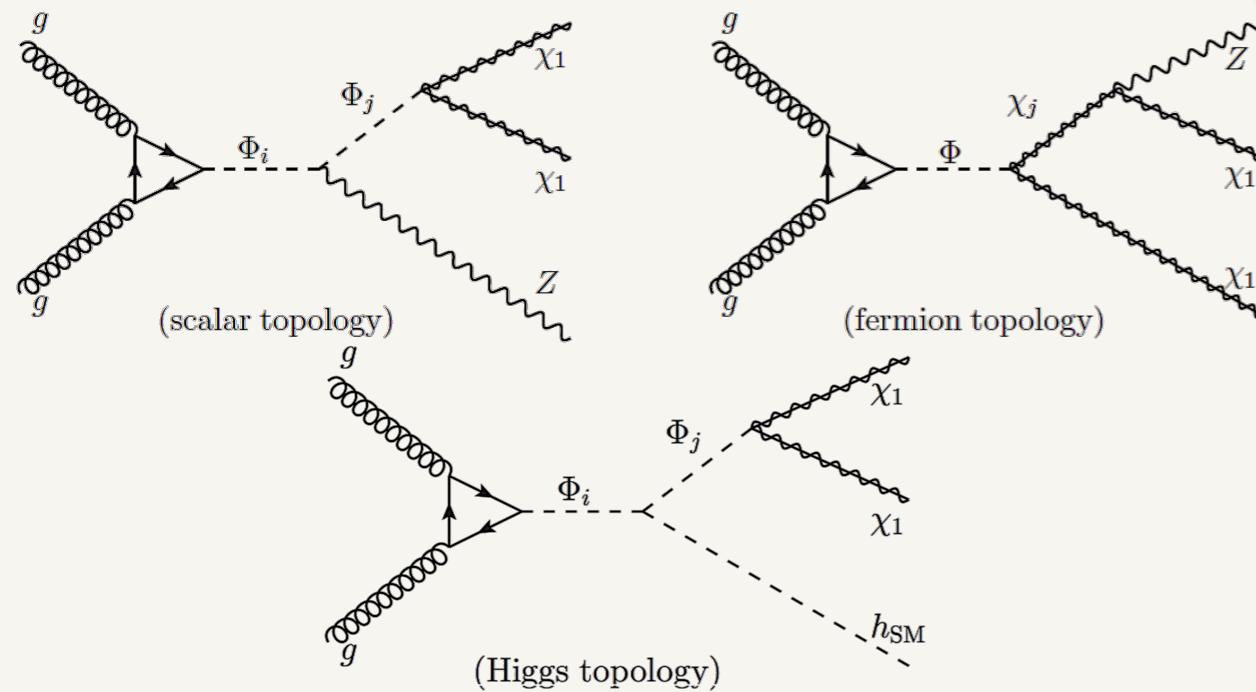

NMSSMTools scans with consistent  $h_{125}$  phenomenology

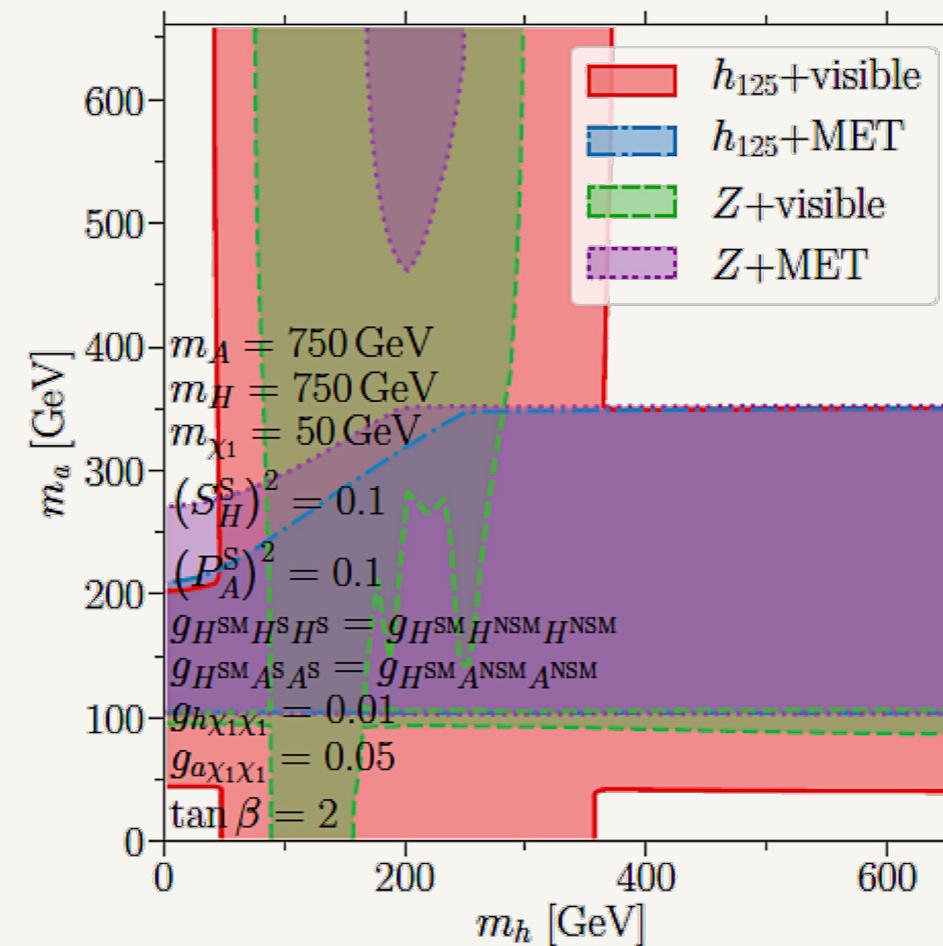

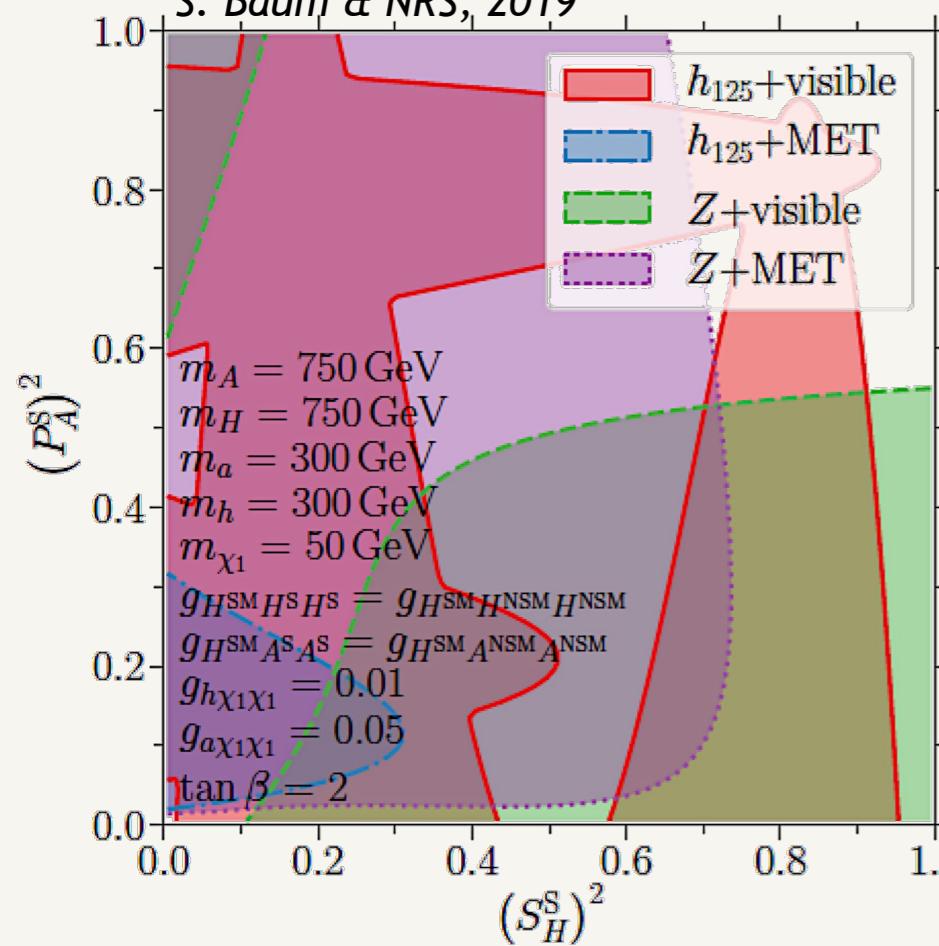

# 2HDM

$H_{\text{NSM}} \rightarrow H_{\text{SM}} H_{\text{SM}}$  or  $Z H_{\text{SM}}$   
suppressed due to alignment

+S

S. Baum & NRS, 2018  
S. Baum & NRS, 2019

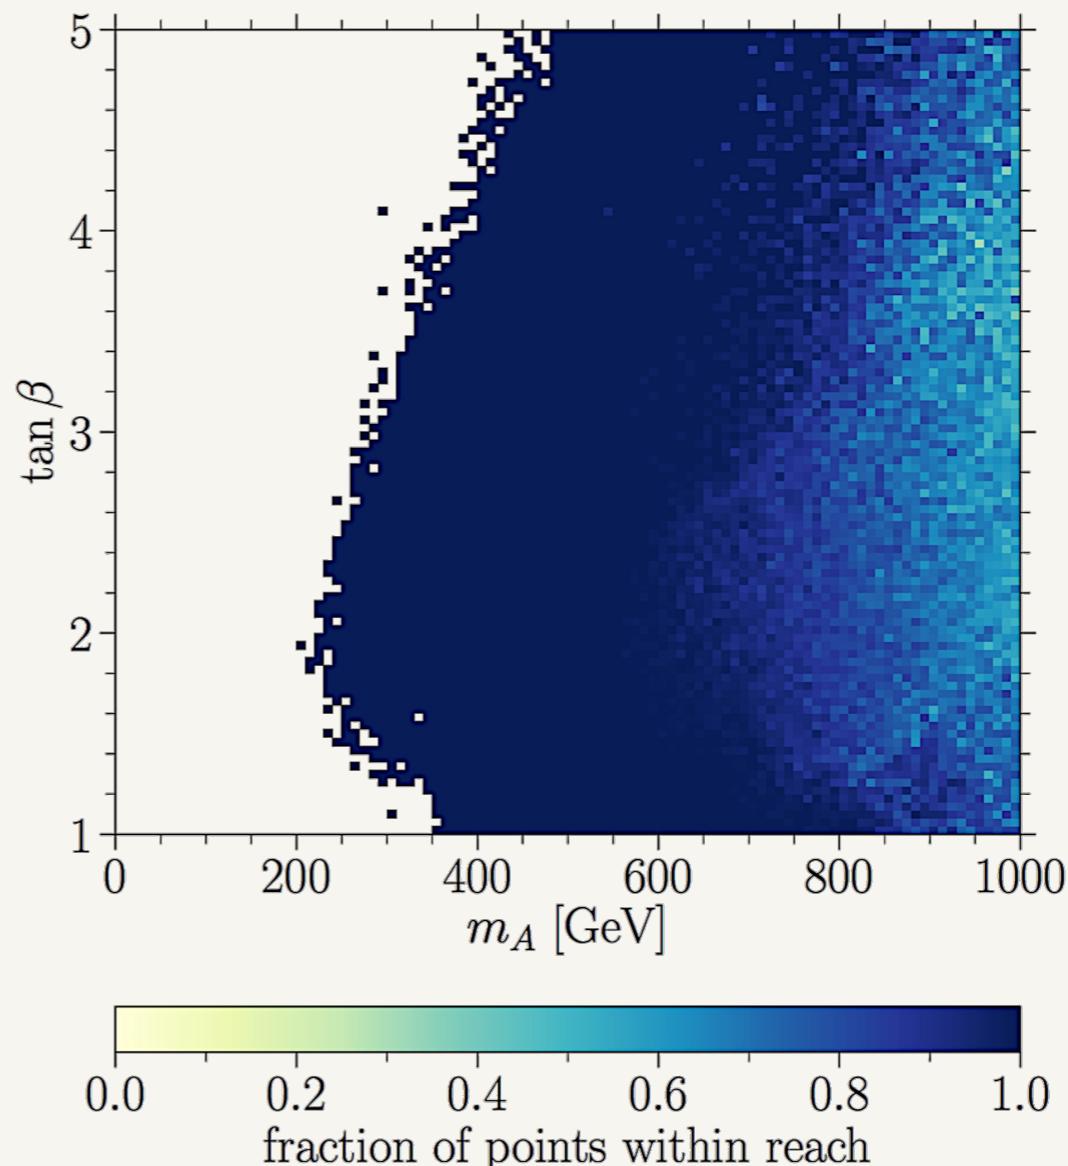

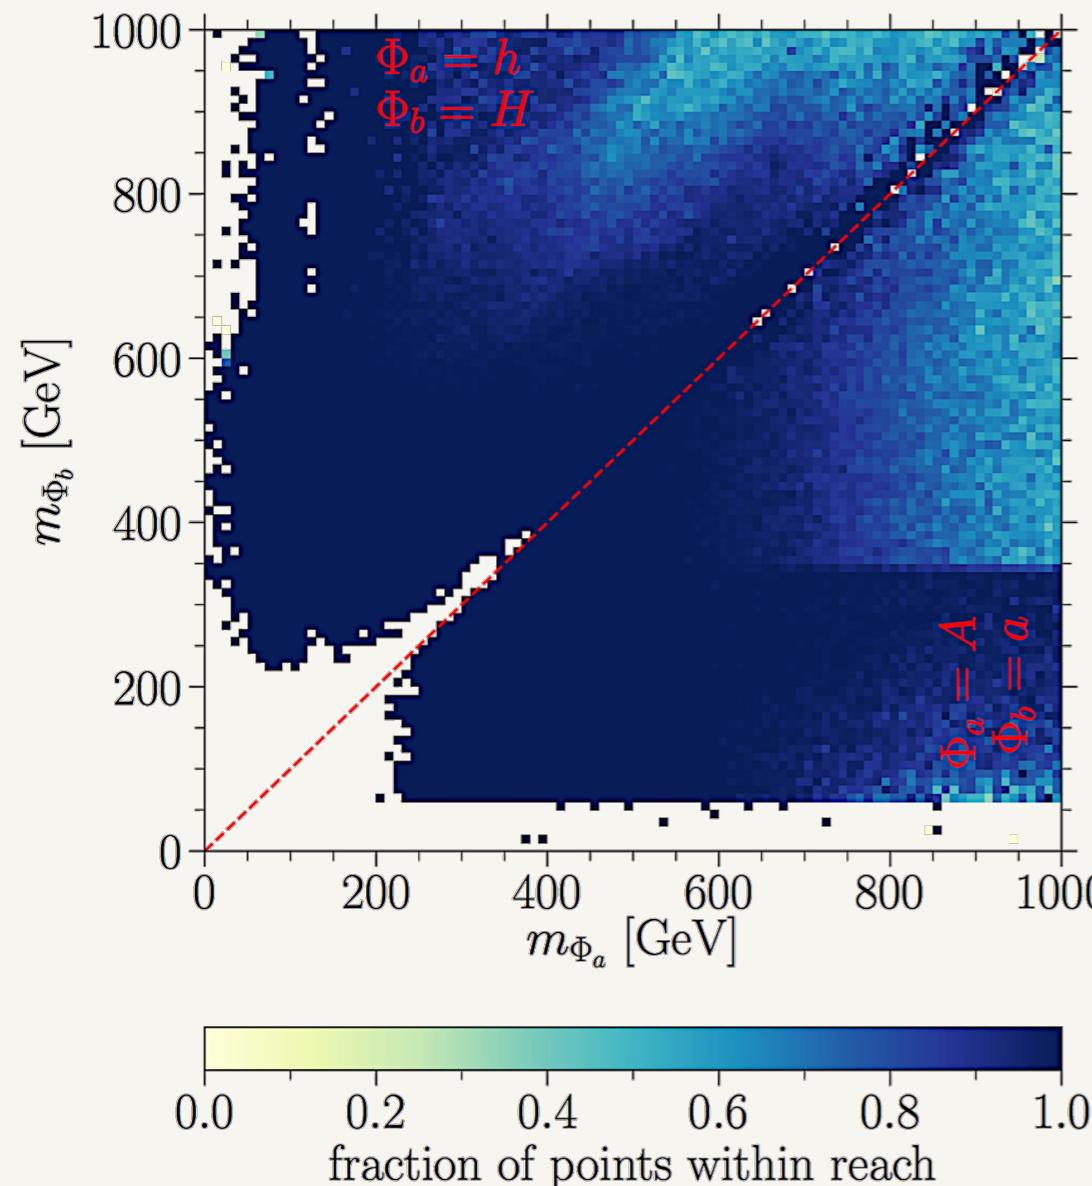

Future reach of the  
different Higgs  
Cascade search  
modes at the LHC  
with  $L = 3000 \text{ fb}^{-1}$  of  
data.

# Heavy Higgs Direct Searches & Cascades!

S. Baum, NRS & K. Freese, 2019

Optimistic assumptions:  
~90% probed with  $3000 \text{ fb}^{-1}$

$$(\max[\mu_{\text{Curr. Lim.}}^{<37 \text{ fb}^{-1}}(\text{conventional})] > 0.01 \text{ or } \max[\mu_{\text{Proj.}}^{3000 \text{ fb}^{-1}}(\text{Higgs cascades})] > 0.1)$$

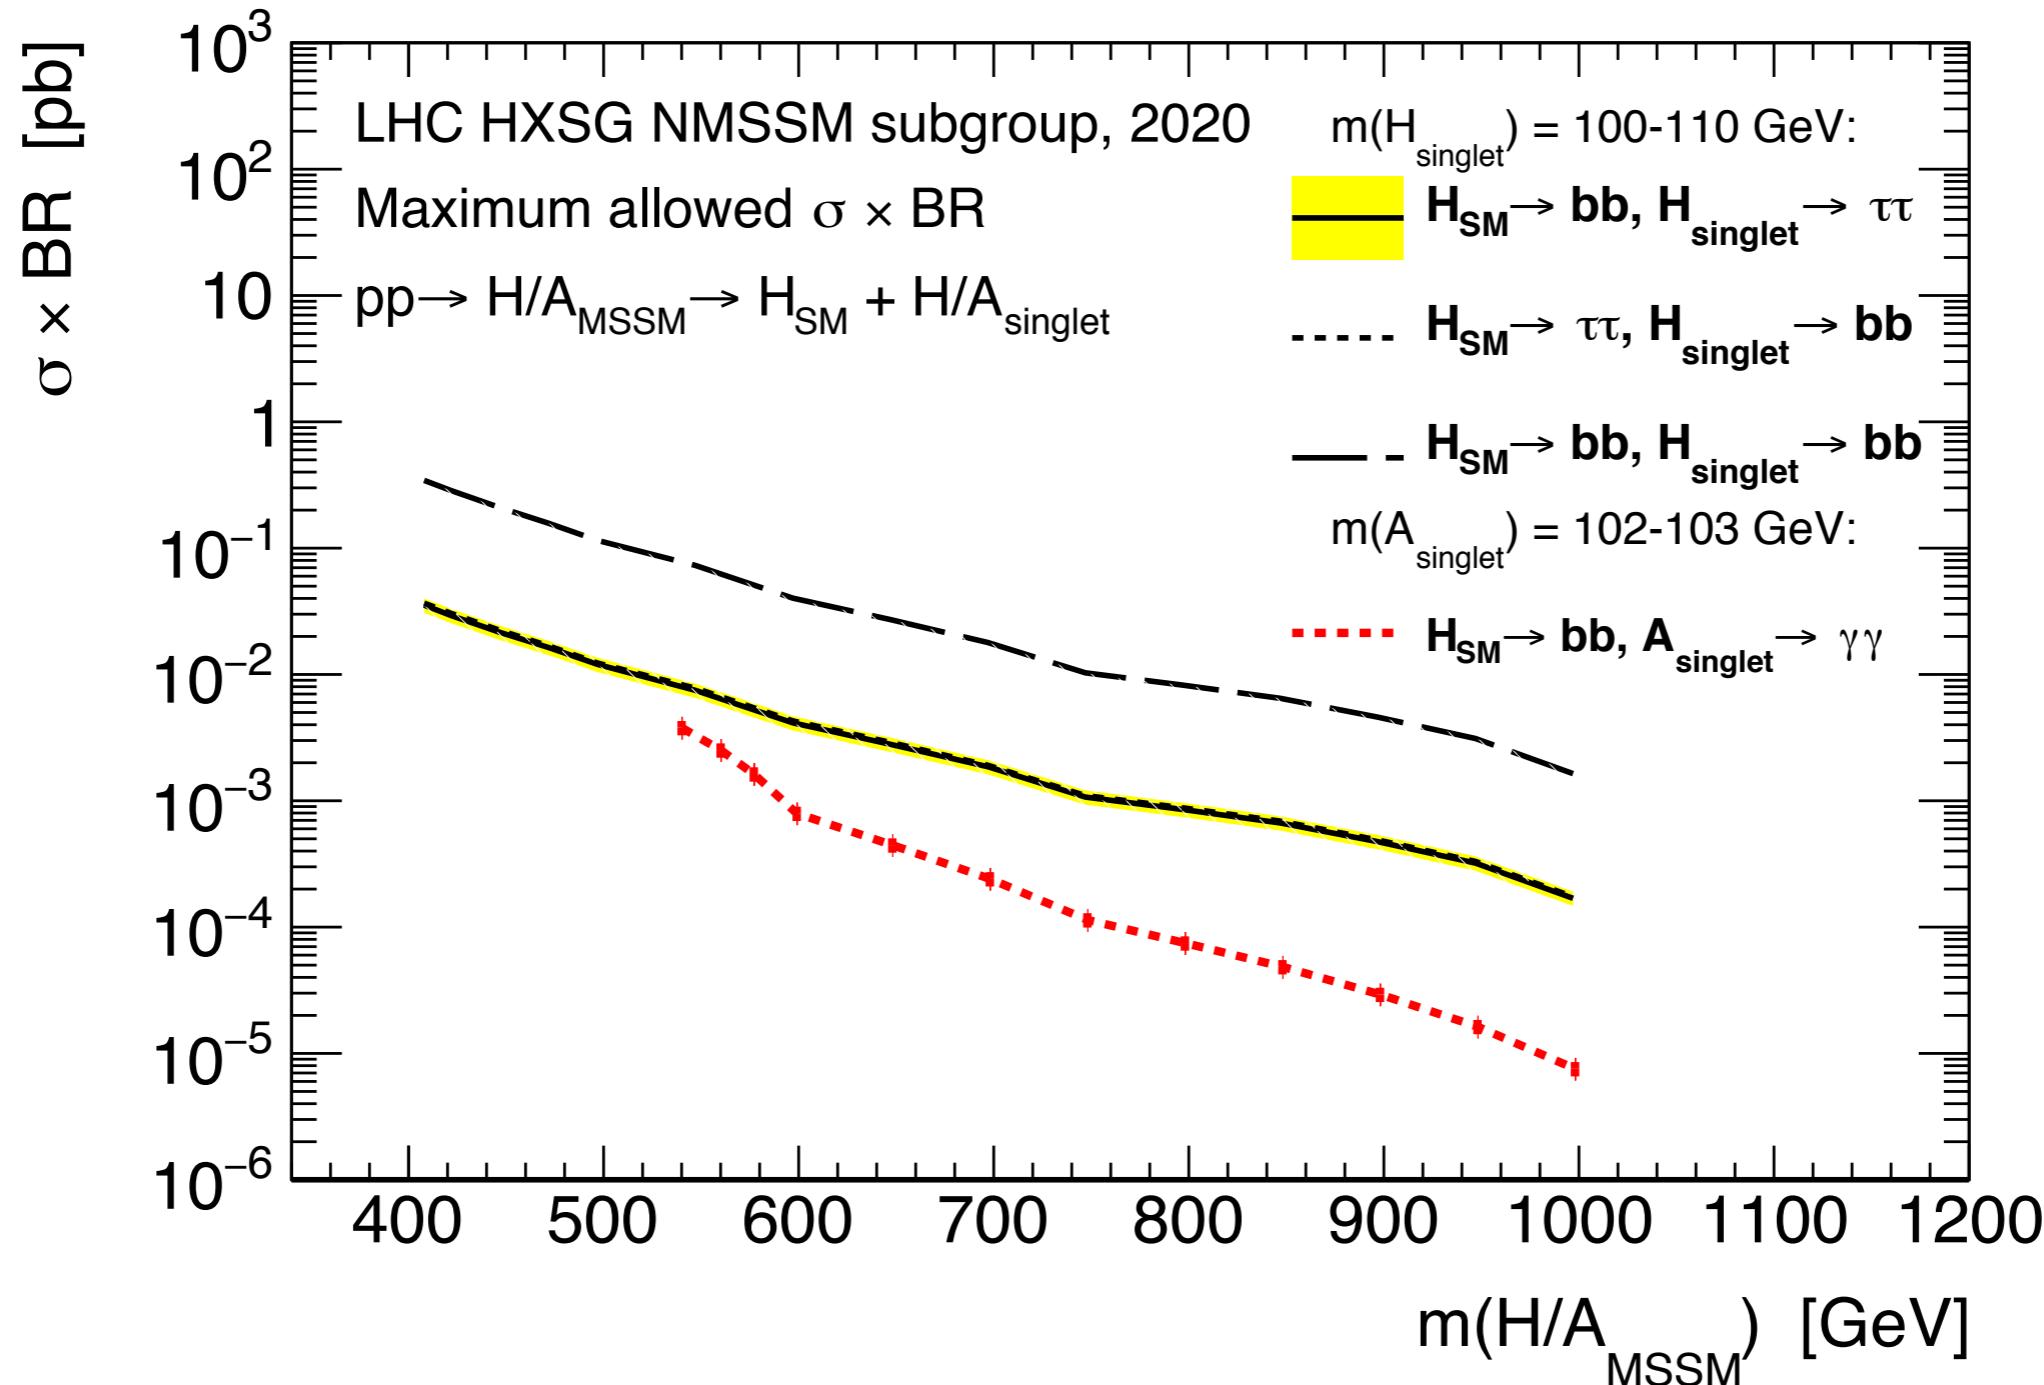

# Benchmark Lines Higgs Pair and Z+Higgs

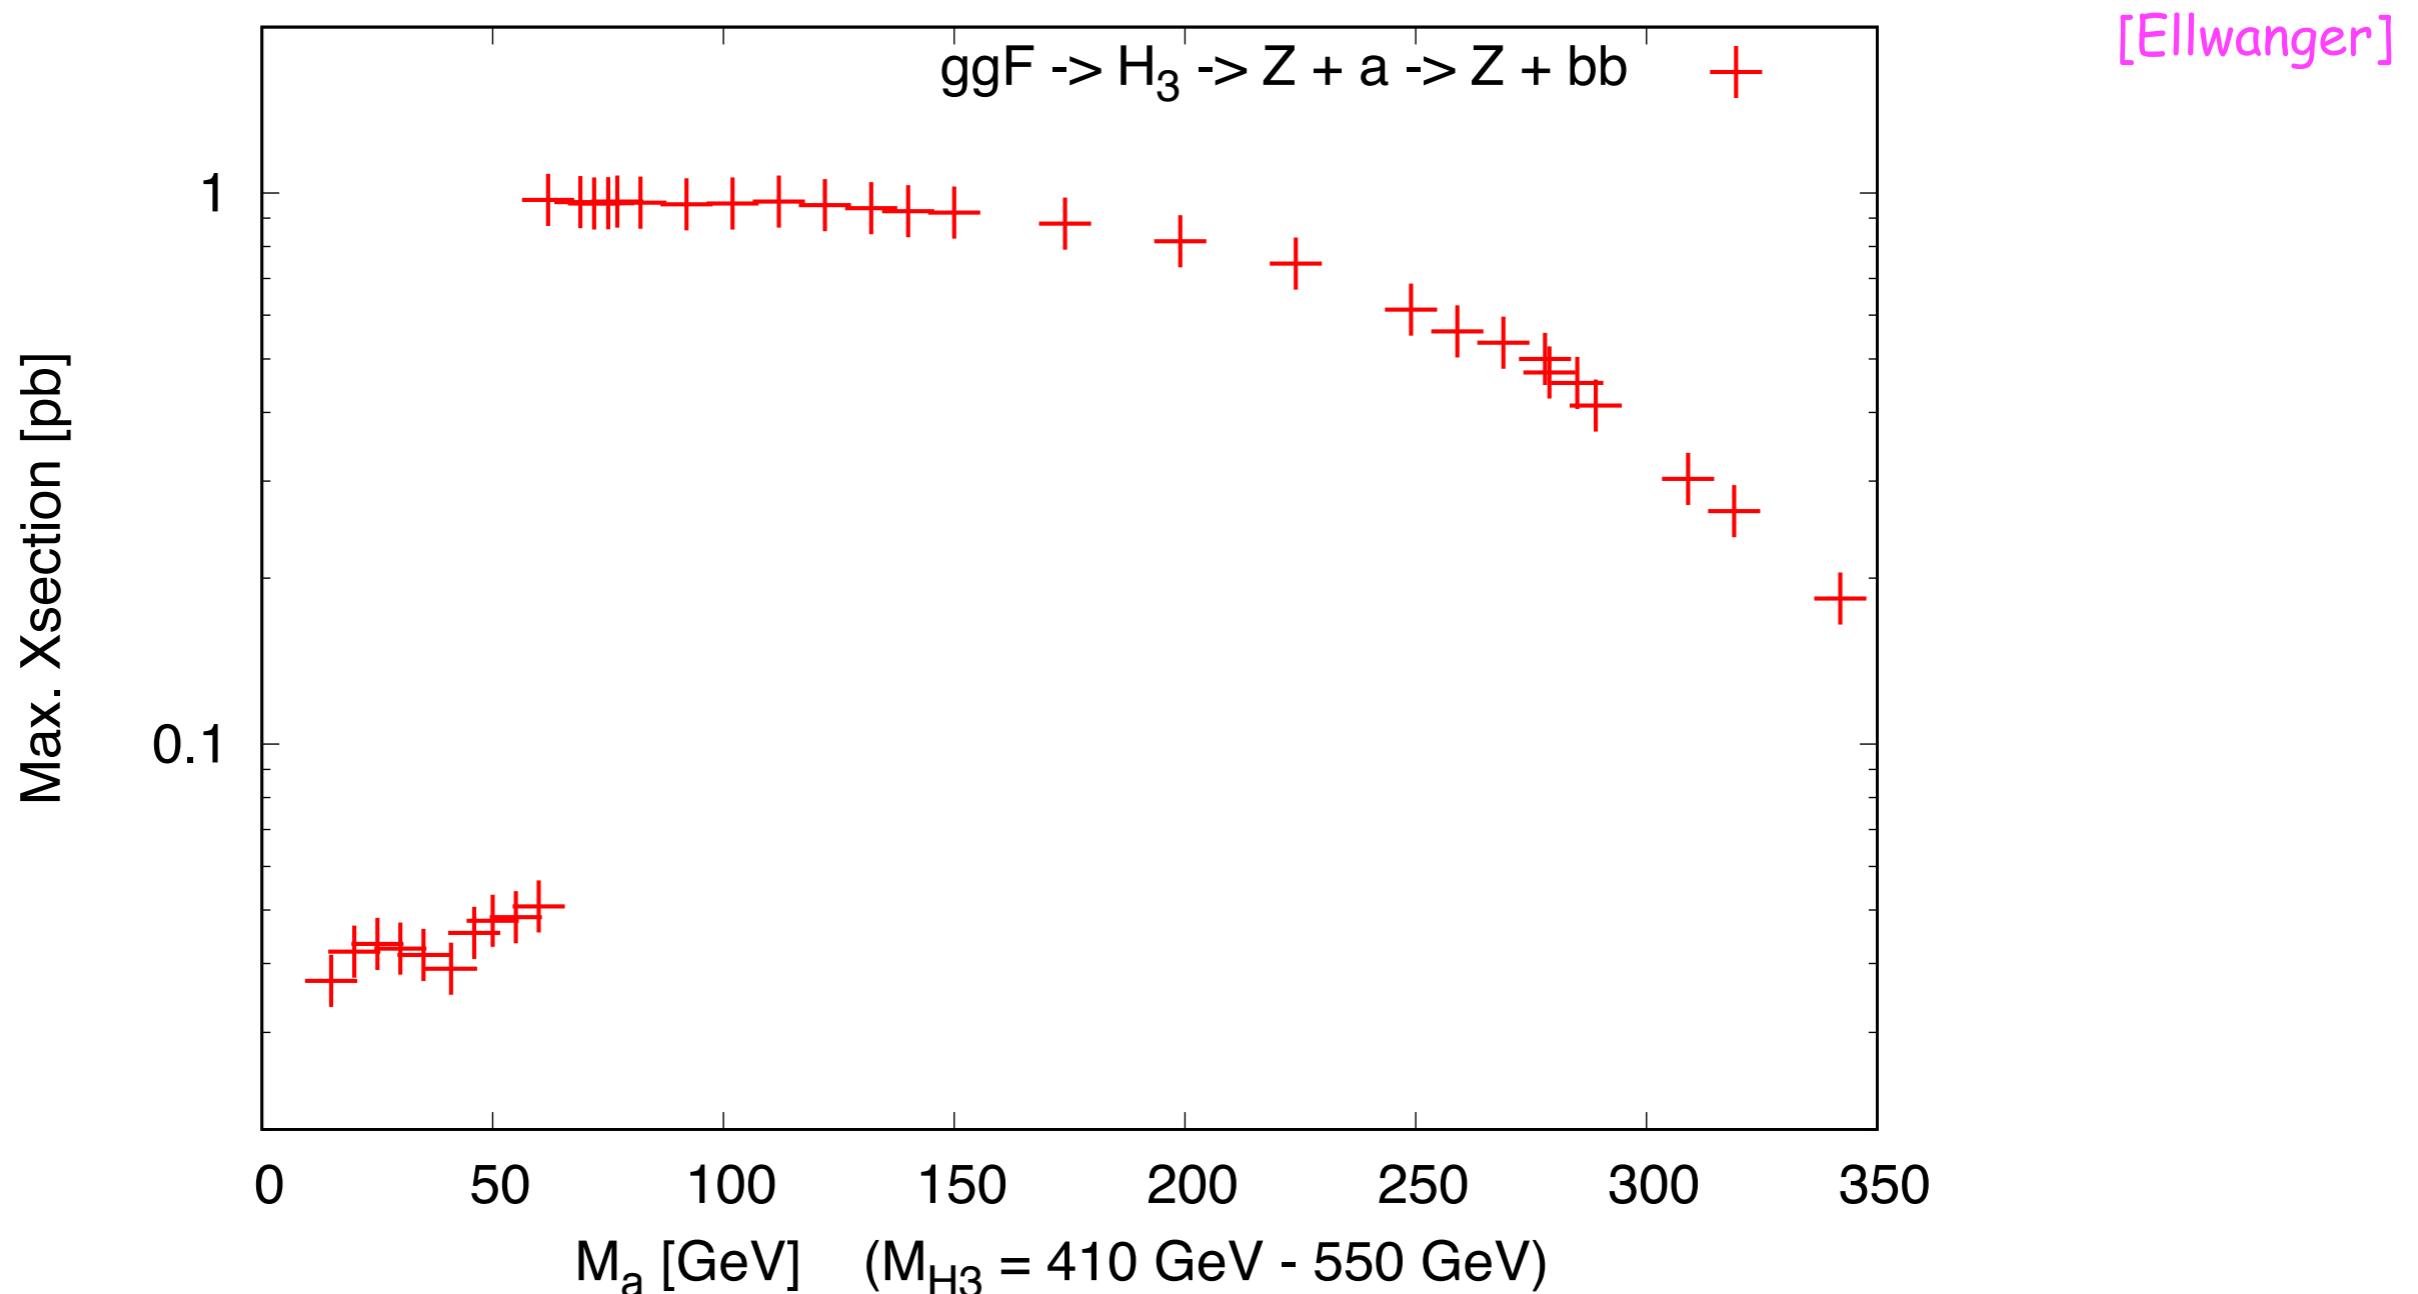

- Non-degenerate masses of NMSSM-specific mostly singlet-like scalar and pseudoscalar Higgs,  $H_s, A_s$ , not constrained by present BSM searches if couplings to SM particles are very small
- Their production is possible in  $H_{\text{MSSM}}$  and  $A_{\text{MSSM}}$  decays
- Trilinear Higgs couplings:  
The (dimensional) trilinear couplings  $H_{\text{MSSM}}-H_s-H_{\text{SM}}$  and  $A_{\text{MSSM}}-A_s-H_{\text{SM}}$  can be particularly large (since not suppressed by the SU(2) symmetry)
- Branching ratios:  
BRs for  $H_{\text{MSSM}} \rightarrow H_s + H_{\text{SM}}$  and  $A_{\text{MSSM}} \rightarrow A_s + H_{\text{SM}}$  can be large, even dominant  
(which would suppress the BRs into  $\tau\tau$ , used for standard searches of HMSSM, AMSSM)
- Search for maximal cross sections  
 $gg \rightarrow H_{\text{MSSM}} \rightarrow H_s + H_{\text{SM}} \rightarrow (bb)(bb) / (bb)(\tau\tau) + (\tau\tau)(bb)$  and  $gg \rightarrow A_{\text{MSSM}} \rightarrow A_s + H_{\text{SM}} \rightarrow (\gamma\gamma)(bb)$   
using NMSSMCALC/NMSSMTools imposing experimental constraints

# Benchmark Lines SM+Singlet Higgs Pair Production

<https://twiki.cern.ch/twiki/bin/view/LHCPhysics/NMSSMBenchmarksMarch2020>

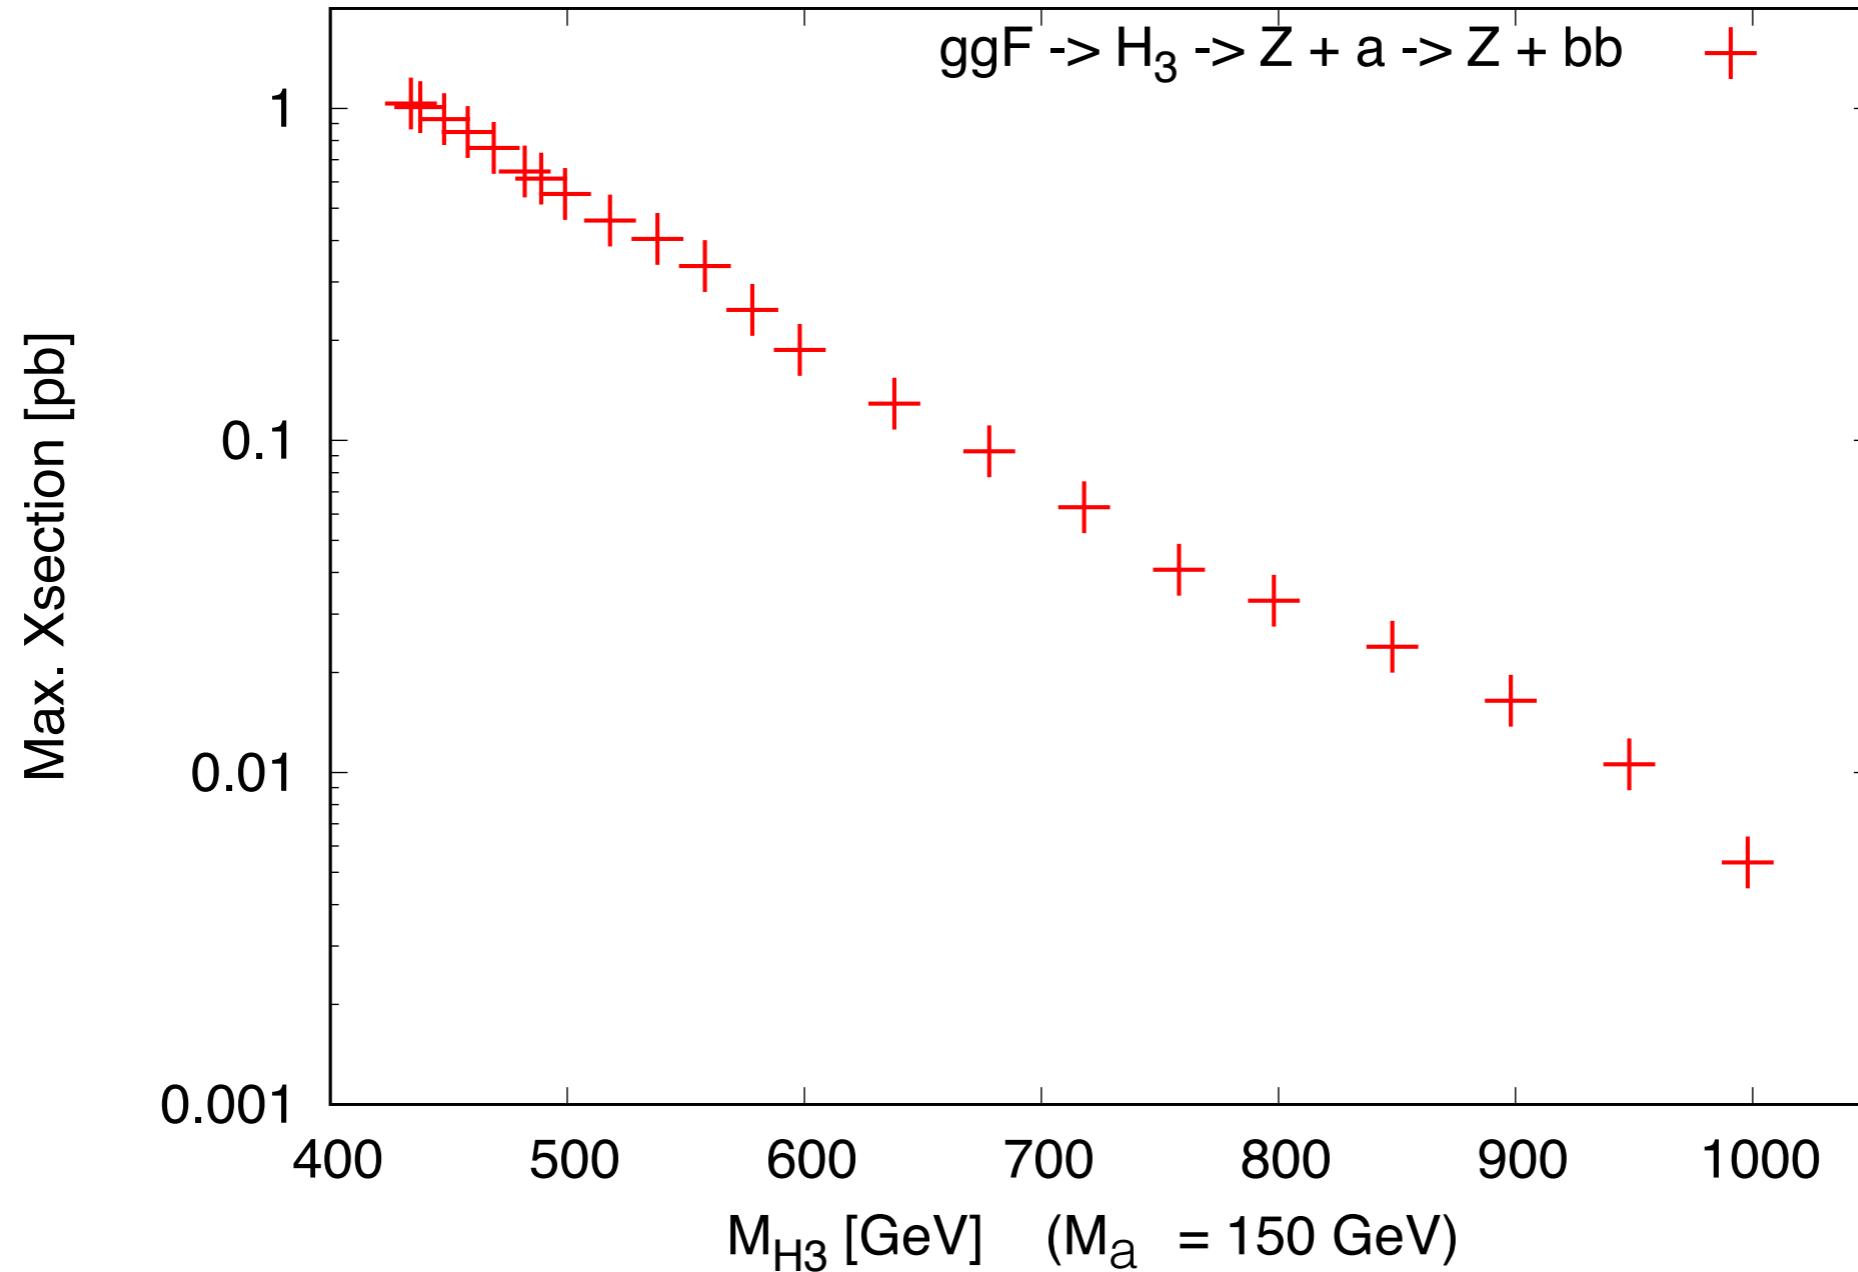

# Benchmark Lines SM+Gauge Boson Production

- generalises benchmark points [MM,Nevzorov,King,Walz,'14], [Baum,Shah,Freese,'19]
- includes experimental constraints, DM relic density required to be smaller than measured value
- cxn drop for  $m_a \leq 62.5$  GeV due to experimental constraints on  $\text{BR}(H_{\text{SM}} \rightarrow aa)$

# Benchmark Lines SM+Gauge Boson Production

[Ellwanger]

- generalises benchmark points [MM,Nevzorov,King,Walz,'14], [Baum,Shah,Freese,'19]
- includes experimental constraints, DM relic density required to be smaller than measured value

# Outlook

---

- Benchmark Lines:  
Extend benchmark lines to different mass combinations and different final states  
**(input from experimentalists required)**
- Benchmark and Exclusion Regions:  
Exact alignment and  $h_{125}$  mass imposes tree-level relations between parameters in the NMSSM =>  
Define NMSSM benchmarks in the CP-odd mass plane denoted by misalignment and/or singlet mixing;  
this could be similar to MSSM  $m_A$ - $\tan\beta$  plane, benchmarks  $mh_{\text{max}}$  etc.
- Relic density impact on Higgs cascades:  
Branching ratios for NMSSM-specific Higgs decays like  $H_{\text{SM}} \rightarrow aa$ ,  $H \rightarrow H_{\text{SM}} + H_{\text{singlet}}$ ,  $A \rightarrow Z + H_{\text{SM}}$  are proportional to NMSSM-specific coupling  $\lambda$  (MSSM limit:  $\lambda \rightarrow 0$ ). For relic density equal to or below observed value,  $\lambda$  cannot be too small, otherwise no singlino-like LSP annihilation into SM particles.  
=> For given BSM Higgs masses, lower bounds for the corresponding  $c \times n^* \times \text{BRs}$  which will be studied
- Precision Calculations (spectrum and decay): ongoing
