

# LZ Outer Detector

IDM Vienna 2022

Dr. Alissa Monte

July 18<sup>th</sup> 2022

# Direct detection with LXe TPCs

S2/S1 is different for electronic and nuclear recoil

Z-position from time between S1, S2

XY from PMT hit map

# LUX-ZEPLIN (LZ): nested detectors

Calibration Source Deployment Tubes (3 Total)

17T Gd-loaded liquid scintillator

120 Outer Detector PMTs

2T LXe Skin Veto

131 Skin PMTs

60,000 gallons of ultrapure water

494 LXe PMTs

7T Active LXe Target

Neutron Calibration Conduit (2 total)

# Time projection chamber (TPC) & LXe skin

I will focus on the Outer Detector, if you want to hear more about the TPC and skin don't miss:

*"LUX-ZEPLIN (LZ) Status"* (our results talk) - A. Fan (tomorrow)

*"Background Model and Statistical Analysis in the LUX-Zeplin Experiment"* – I. Olcina (next talk)

*"Identification and removal of coincidence backgrounds in the LUX-ZEPLIN experiment"* – D. Hunt (poster)

*"Background model fitting in the LUX-ZEPLIN experiment"*  
- A. Musalhi (poster)

# LZ's Outer Detector (OD)

Neutron detector with 95% design efficiency

[NIM A 937 \(2019\)](#), [NIM A 1010 \(2021\)](#)

10 acrylic tanks filled with  
17t Gadolinium-loaded liquid scintillator  
Observed by 120 8" R5912 PMTs  
40 optical fiber injection points for calibration

Tanks from  
Reynold's Polymer

GdLS manufactured at  
Brookhaven National Lab

# Outer detector installation

**Side acrylic vessel lowering into water tank**

**Post acrylic tank cleaning yoga**

**All acrylic vessels in place**

**PMT and Tyvek installation**

**OD construction completed and tanks filled spring 2021**

# Neutron interactions with the OD

GdLS

Linear Alkylbenzene (LAB)

2,5-Diphenyloxazole (PPO)

1,4-bis(methylstyryl) benzene (Bis-MSB)

Trimethylhexanoic Acid (TMHA)

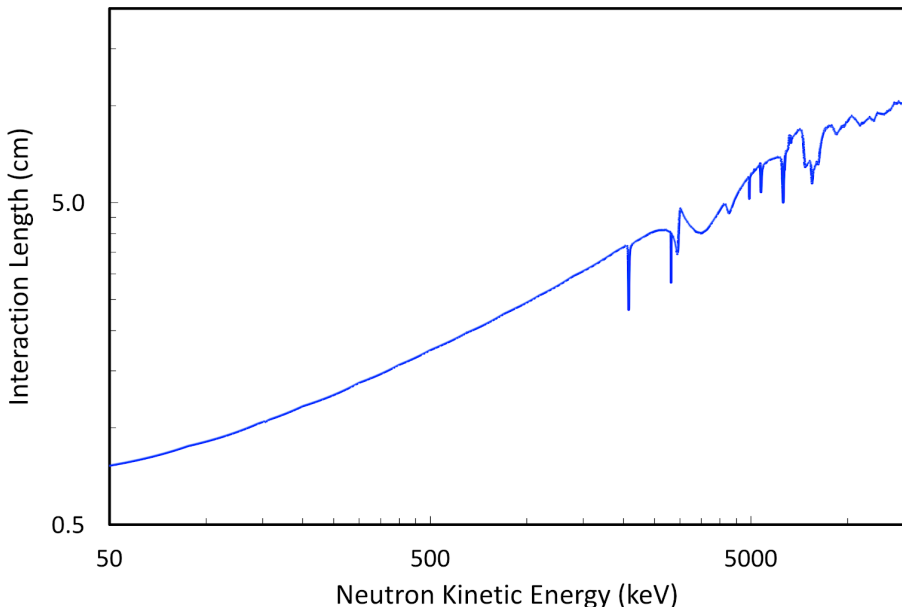

Gadolinium (Gd), neutron eater

Neutron loses energy scattering on protons in scintillator/acrylic

Neutron captures on Gd or H

H produces a 2.2 MeV  $\gamma$ , Gd produces 4-5  $\gamma$ s totaling ~8 MeV

Neutrons in LAB

$^{155}\text{Gd}$ : 8.5 MeV

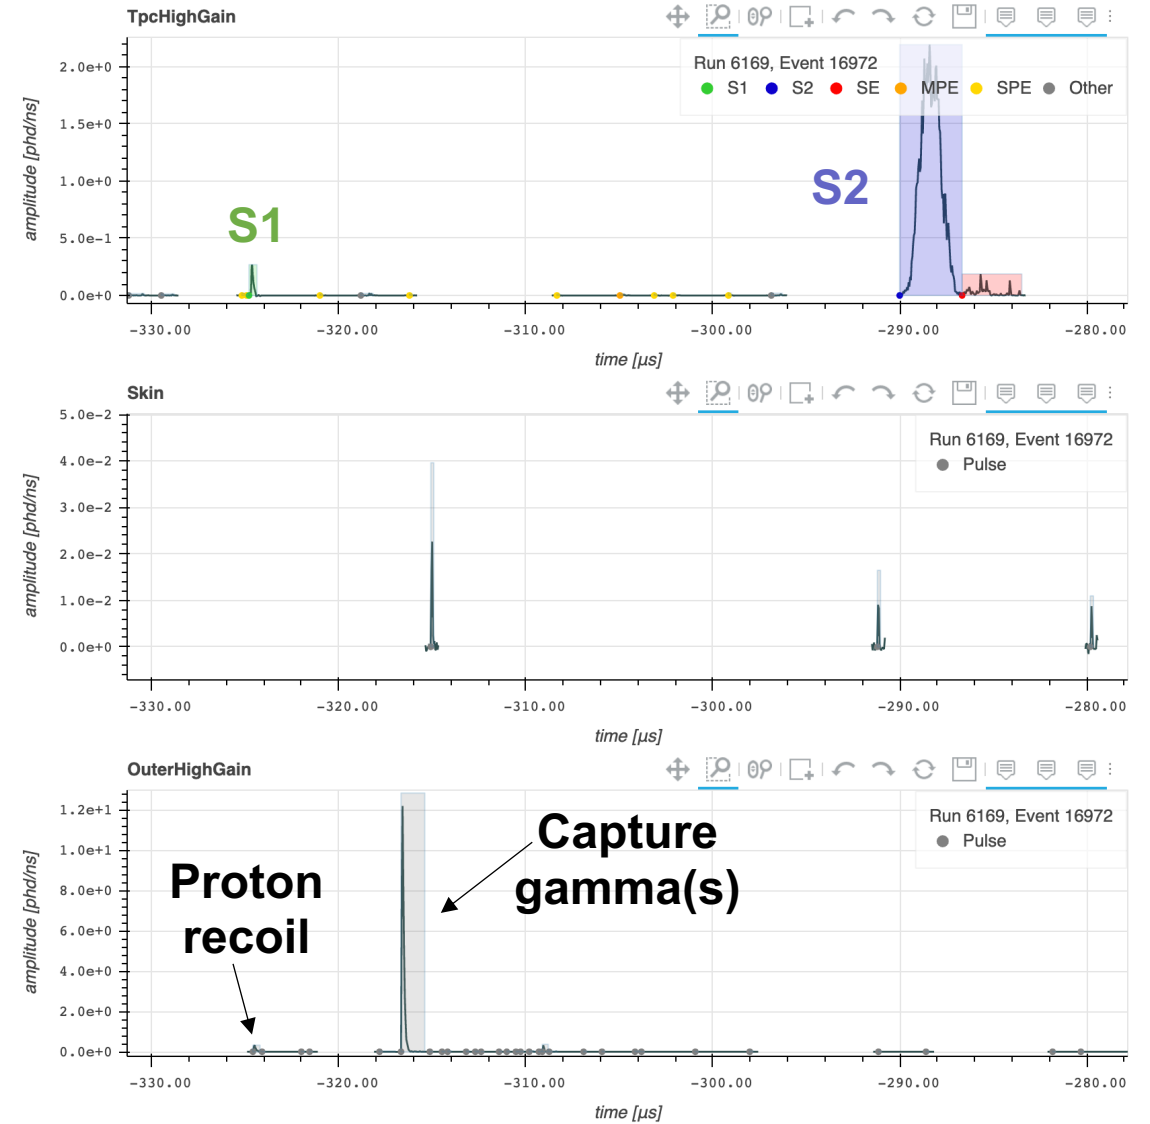

$^{157}\text{Gd}$ : 7.9 MeV

# Tagging neutrons in the OD

Real LZ AmLi calibration neutron event

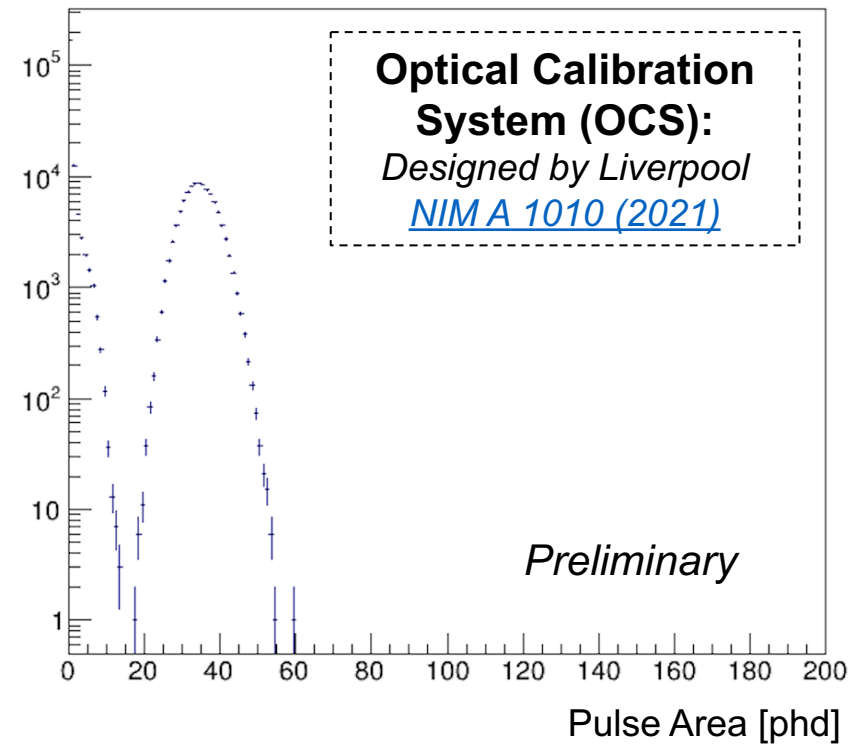

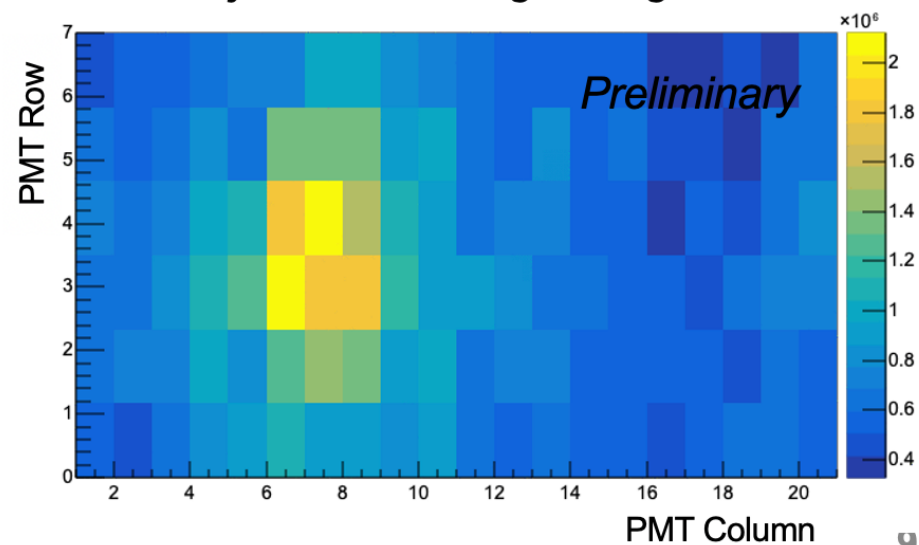

# Calibration of the OD: OCS

*40 injection points used to calibrate PMT single photon response, measure afterpulsing, study light collection efficiency*

*OCS injections moving through fibers*

# Calibration of the OD

Source in tungsten shield lowered to top of OCV (low energy neutrons)

Gamma and neutron sources loaded on upper deck and lowered to specific Z position via computer-controlled motors

Photoneutron sources: YBe

3 external CSD tubes – neutrons and gammas  
 $AmLi$ ,  $^{252}Cf$ ,  $^{22}Na$ ,  $^{228}Th$

2 neutron conduits: DD neutrons,  $D_2O$  reflector

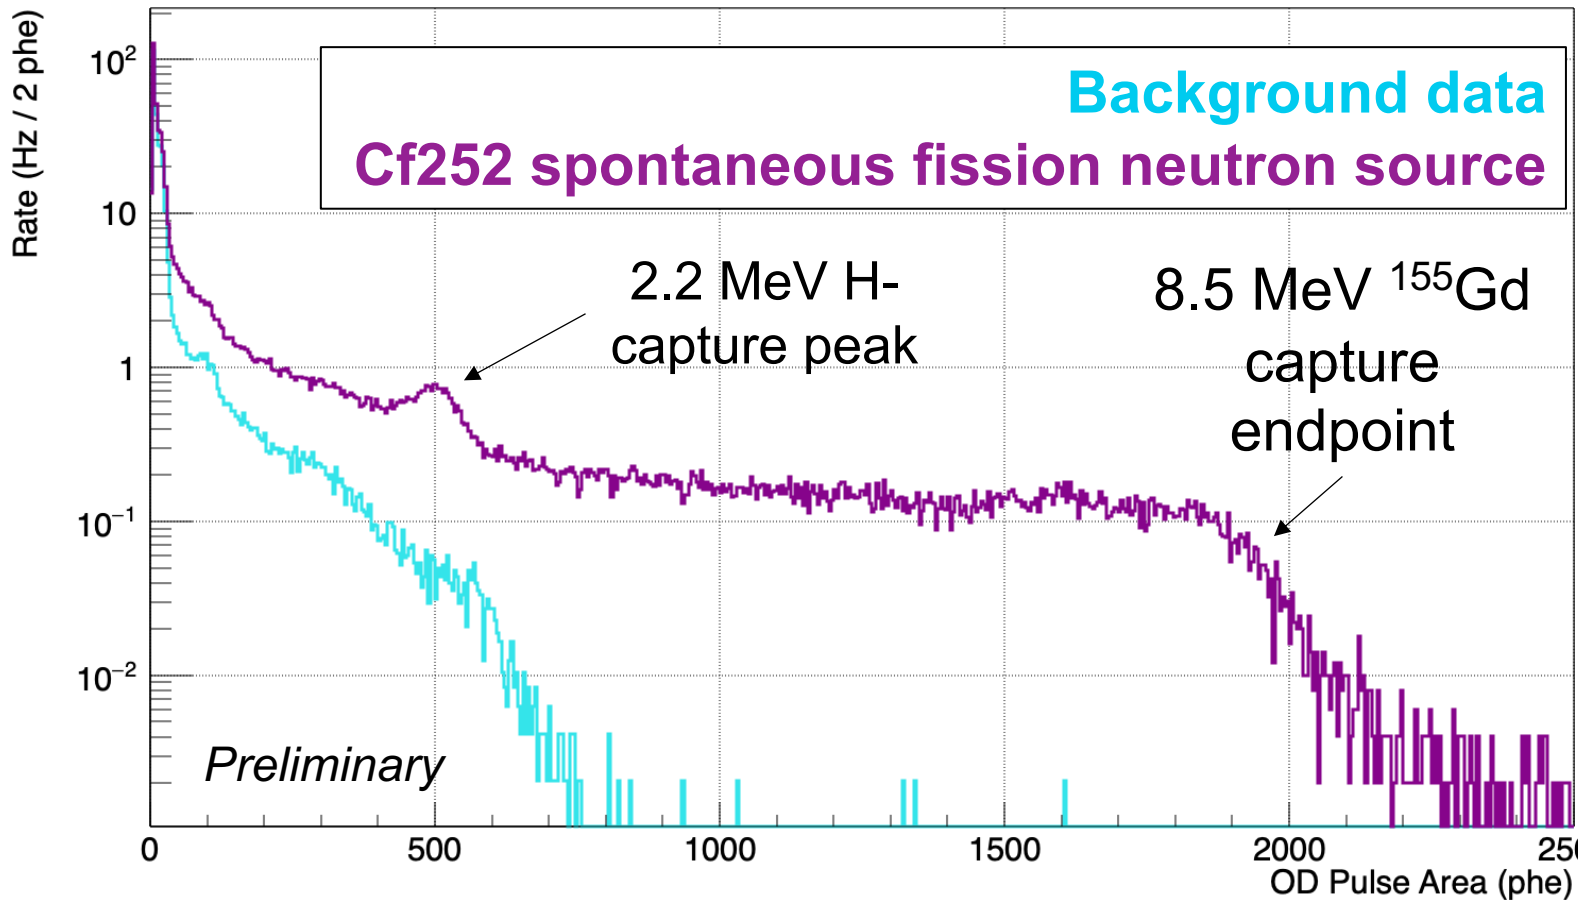

3 source tubes enter here and sit in vacuum between inner and outer vessels

# OD background and neutron calibration spectra

Experiment	phe/MeV
<a href="#">RENO</a>	150
<a href="#">Borexino</a>	438
<a href="#">Daya Bay</a>	162
<a href="#">Kamland</a>	200
<a href="#">SNO+</a>	300
LZ OD	230

*GdLS response measured with  $^{208}\text{Tl}$ ,  $^{22}\text{Na}$ ,  $^{57}\text{Co}$ , H/Gd-captures*

$E_{true}$  is the true energy deposited in the GdLS

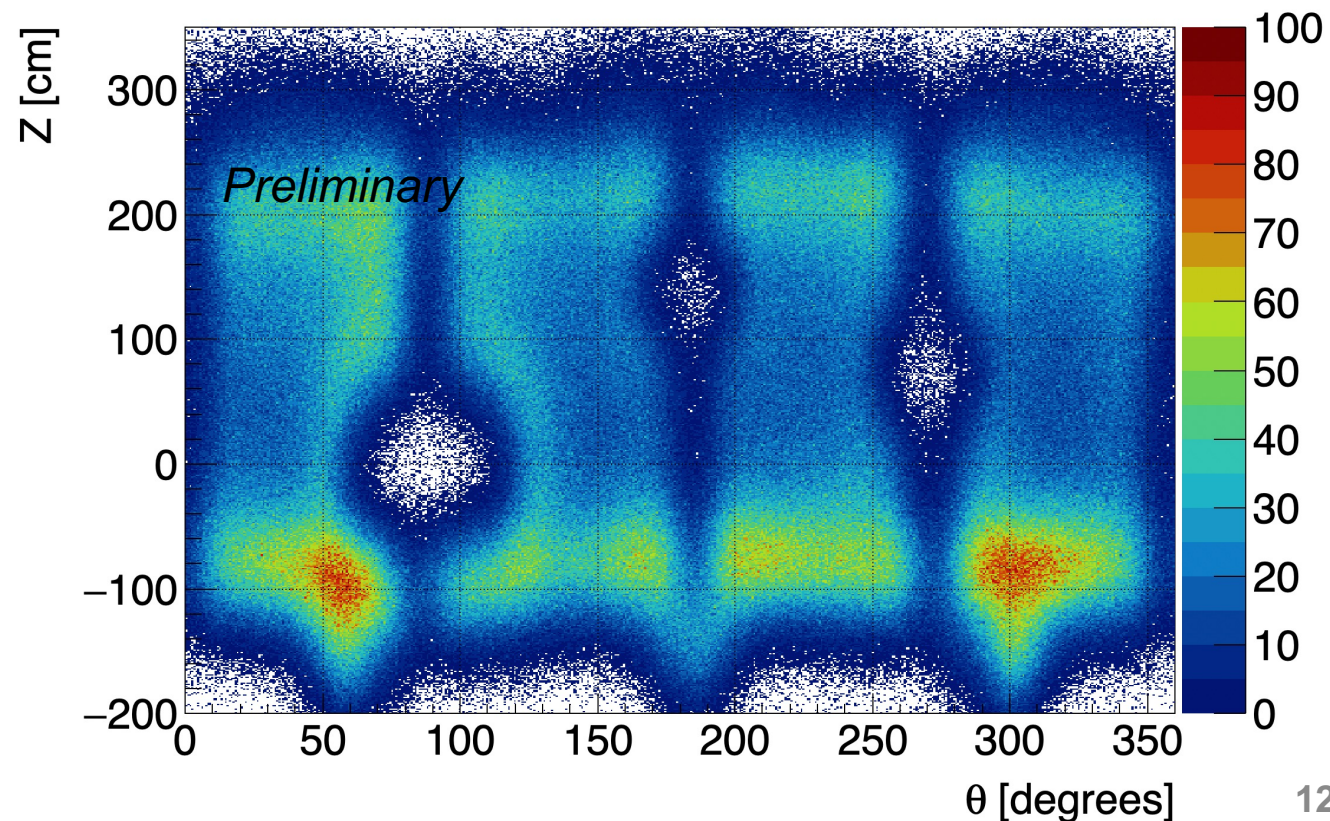

$E_{vis}$  is the visible energy accounting for nonlinear GdLS response

# Position reconstruction

*We resolve individual tanks through a simple centroid position reconstruction!  
(Z-position is corrected based on CSD gamma calibration)*

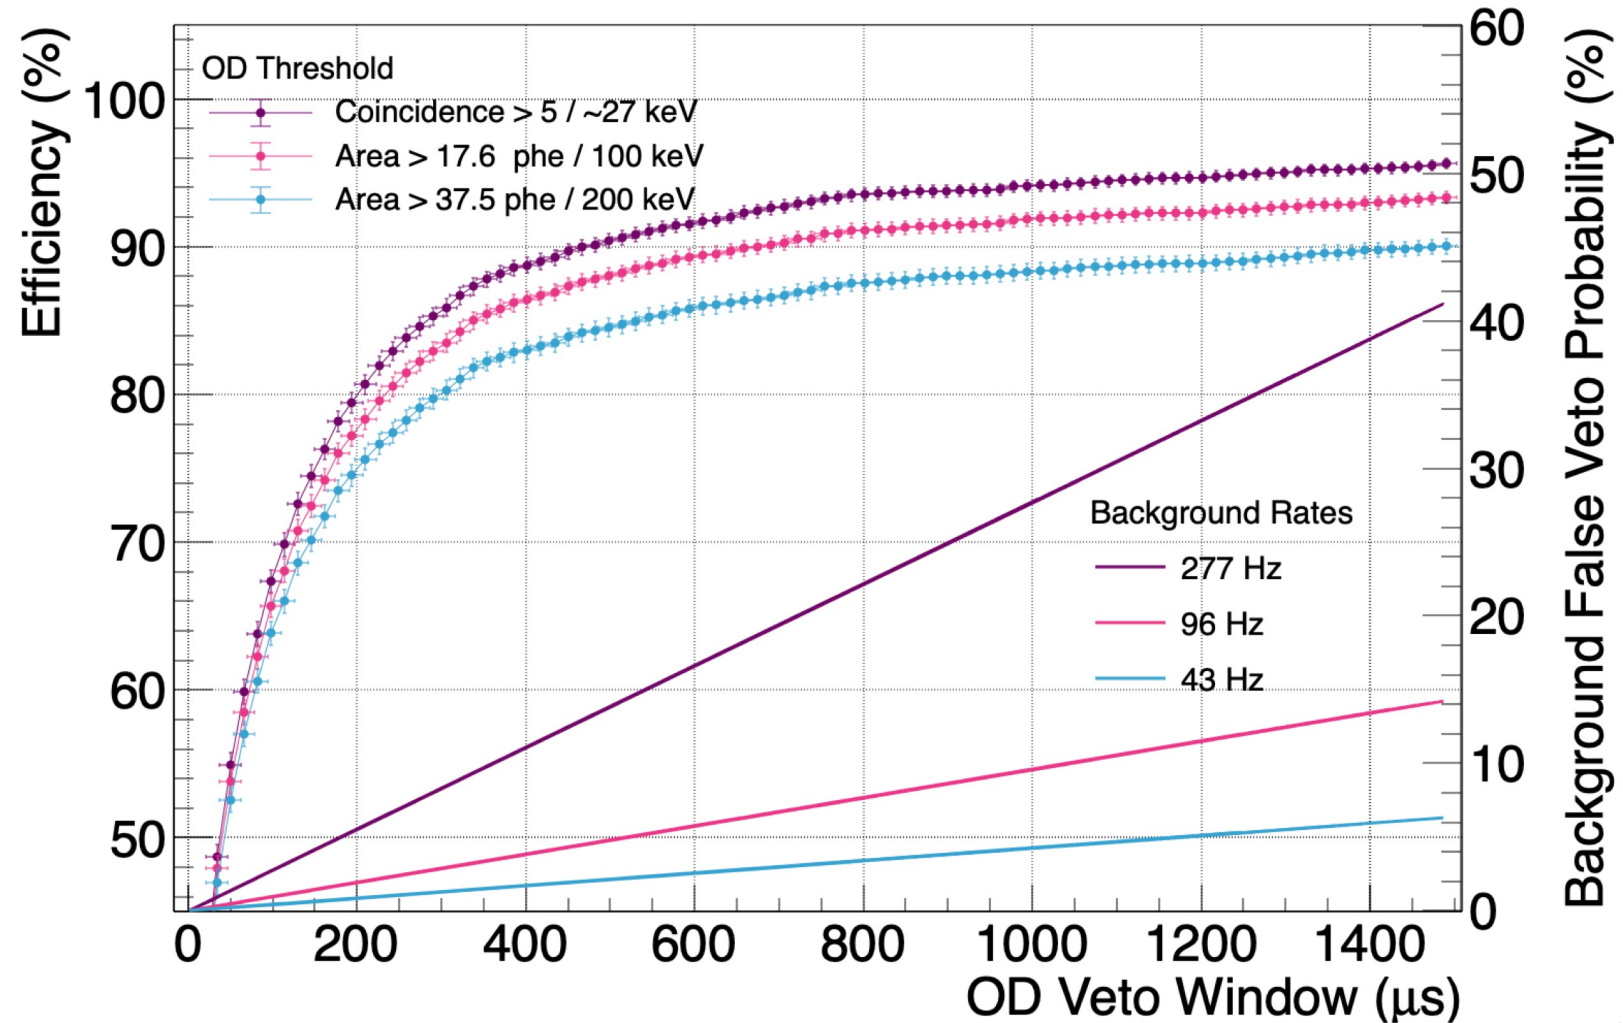

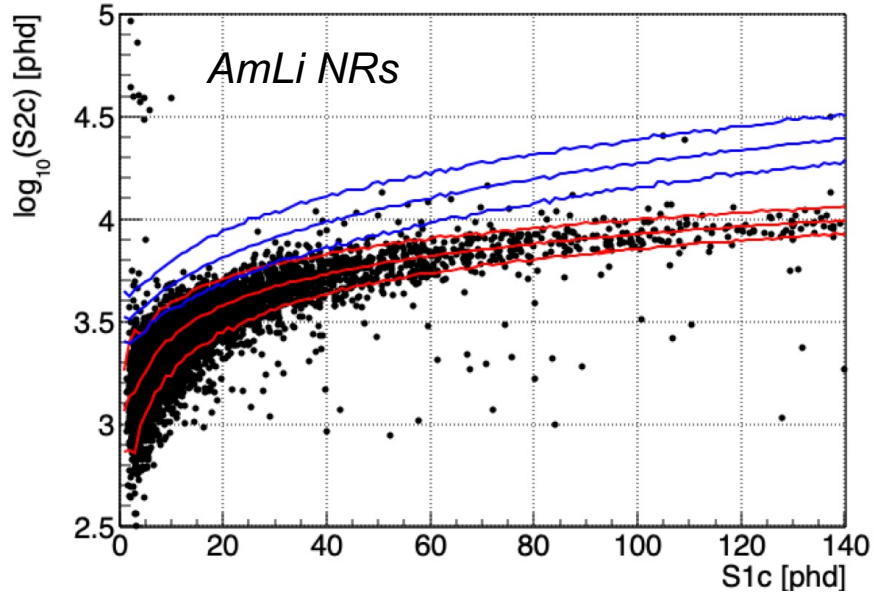

*Can correlate angle between TPC, skin, OD*

# Neutron tagging efficiency measured with AmLi

*Assess efficiency and false veto fraction for different windows and thresholds*

# Neutron tagging efficiency versus position

Source locations

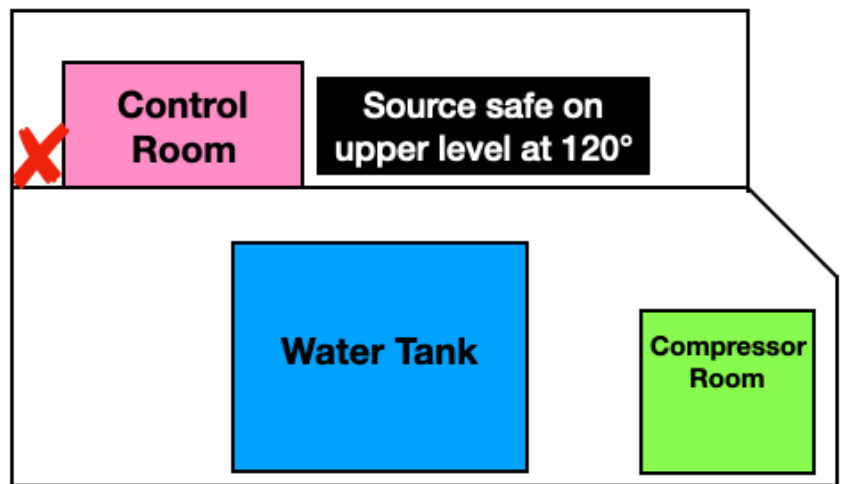

# The OD in Science Run 1 (SR1)

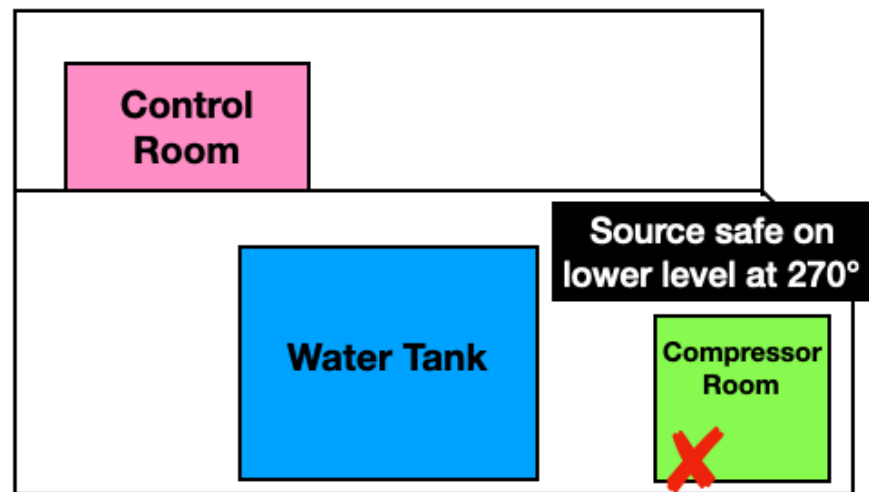

# The OD saw neutrons from inside our source safe

Steel Pyramid

Steel Pyramid

Source safe moved from lower Davis to upper deck

Consistent with neutron captures on Steel:

- $^{56}\text{Fe}$  (7.65 MeV),
- $^{58}\text{Ni}$  (9 MeV),
- $^{50}\text{Cr}$  (9.26 MeV),
- $^{52}\text{Cr}$  (7.54 MeV),
- $^{53}\text{Cr}$  (9.72 MeV)

# OD constraints for the WIMP search

- Neutron backgrounds, “Det. NR”, with OD tag are 7.7 times larger than without (tagging efficiency is 88.5%)
- 5% of non-neutron backgrounds have an accidental OD tag by design
- We use OD-tagged data to set data-driven constraint on the rate of Det. NR:  $< 0.2$  events (2-sided constraint)
- Consistent with simulation estimate of 0.06 events in 60 live-days
- OD is performing very well and has helped us get to our first science result!

# Thank you!

**And thanks to our sponsors and participating institutions!**

>35 institutions in USA, UK, Portugal, and Korea | ~250 scientists, engineers, and technical staff

# Extras

---

# Why we think external neutrons capture on steel

## **GdLS capture energies:**

$^{155}\text{Gd}$  (8.5 MeV)

$^{157}\text{Gd}$  (7.9 MeV)

## **Steel element capture energies:**

$^{56}\text{Fe}$  (7.65 MeV),

$^{58}\text{Ni}$  (9 MeV),

$^{50}\text{Cr}$  (9.26 MeV),

$^{52}\text{Cr}$  (7.54 MeV),

$^{53}\text{Cr}$  (9.72 MeV)

**Higher bump in conduit full data  
consistent with >9 MeV captures**

# OD background rate

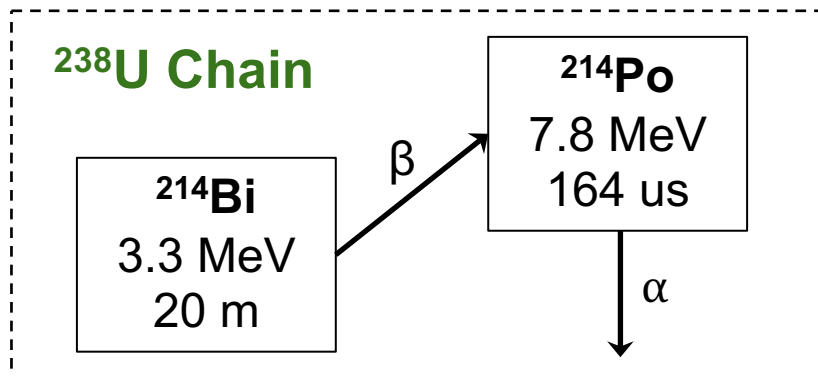

*Background rate consistent with prediction!*

System	Component	OD Rate (Hz)
<b>PMTs</b>	PMTs	0.31
