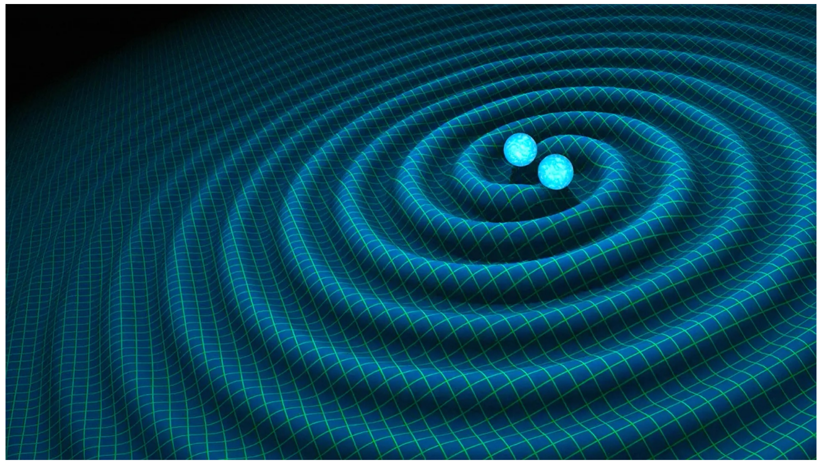
Effective current for gravitational waves

Gravitational waves act as a source term to Maxwell's equations, effectively inducing an electromagnetic current.

$$g_{\mu\nu} = \eta_{\mu\nu} + h_{\mu\nu} \qquad \left|h_{\mu\nu}\right| \ll 1$$



$$j^{\mu}_{\text{eff}} = \partial_{\nu}\left(-\frac{1}{2}h\,F^{\mu\nu} + F^{\mu\alpha}h^{\nu}{}_{\alpha} - F^{\nu\alpha}h^{\mu}{}_{\alpha}\right)$$

Conclusions

The axion program may discover not only the dark matter of our Universe, but also exotic sources of gravitational waves

A number of distinct experimental proposals have coalesced on a strain sensitivity of 10^{-22} for MHz GWs, a level that is still orders of magnitude away from any signal of the early Universe. Whether we can hope to probe such strain sensitivities remains to be determined.

- In the TT frame, the description of rigid bodies becomes unintuitive, as their coordinates are deformed by a passing GW due to the motion of the coordinate system. **This is crucial to implement boundary conditions.**
- In the proper detector frame the coordinate system is defined by rigid rulers and closely matches the intuitive description of an Earth-based laboratory, with the GW acting as a Newtonian force.
- Previous confusion in the literature due to this (see e.g. 2012.12189)
