"particle"

Even Lighter DM

Alvaro E. Chavarria

University of Washington

DAMIC-M

CENPA

Center for Experimental Nuclear Physics and Astrophysics

UNIVERSITY of WASHINGTON

Outline

- Dark matter (DM) direct-detection signal.
- Electronic recoils to search for even lighter DM.
- Charge-coupled devices (CCDs) fundamentals and performance.
- DAMIC at SNOLAB and the DAMIC excess.
- SENSEI.
- DAMIC-M and its prototype detectors.
- Oscura.
- SuperCDMS and EDELWEISS HV detectors.
- Outlook.

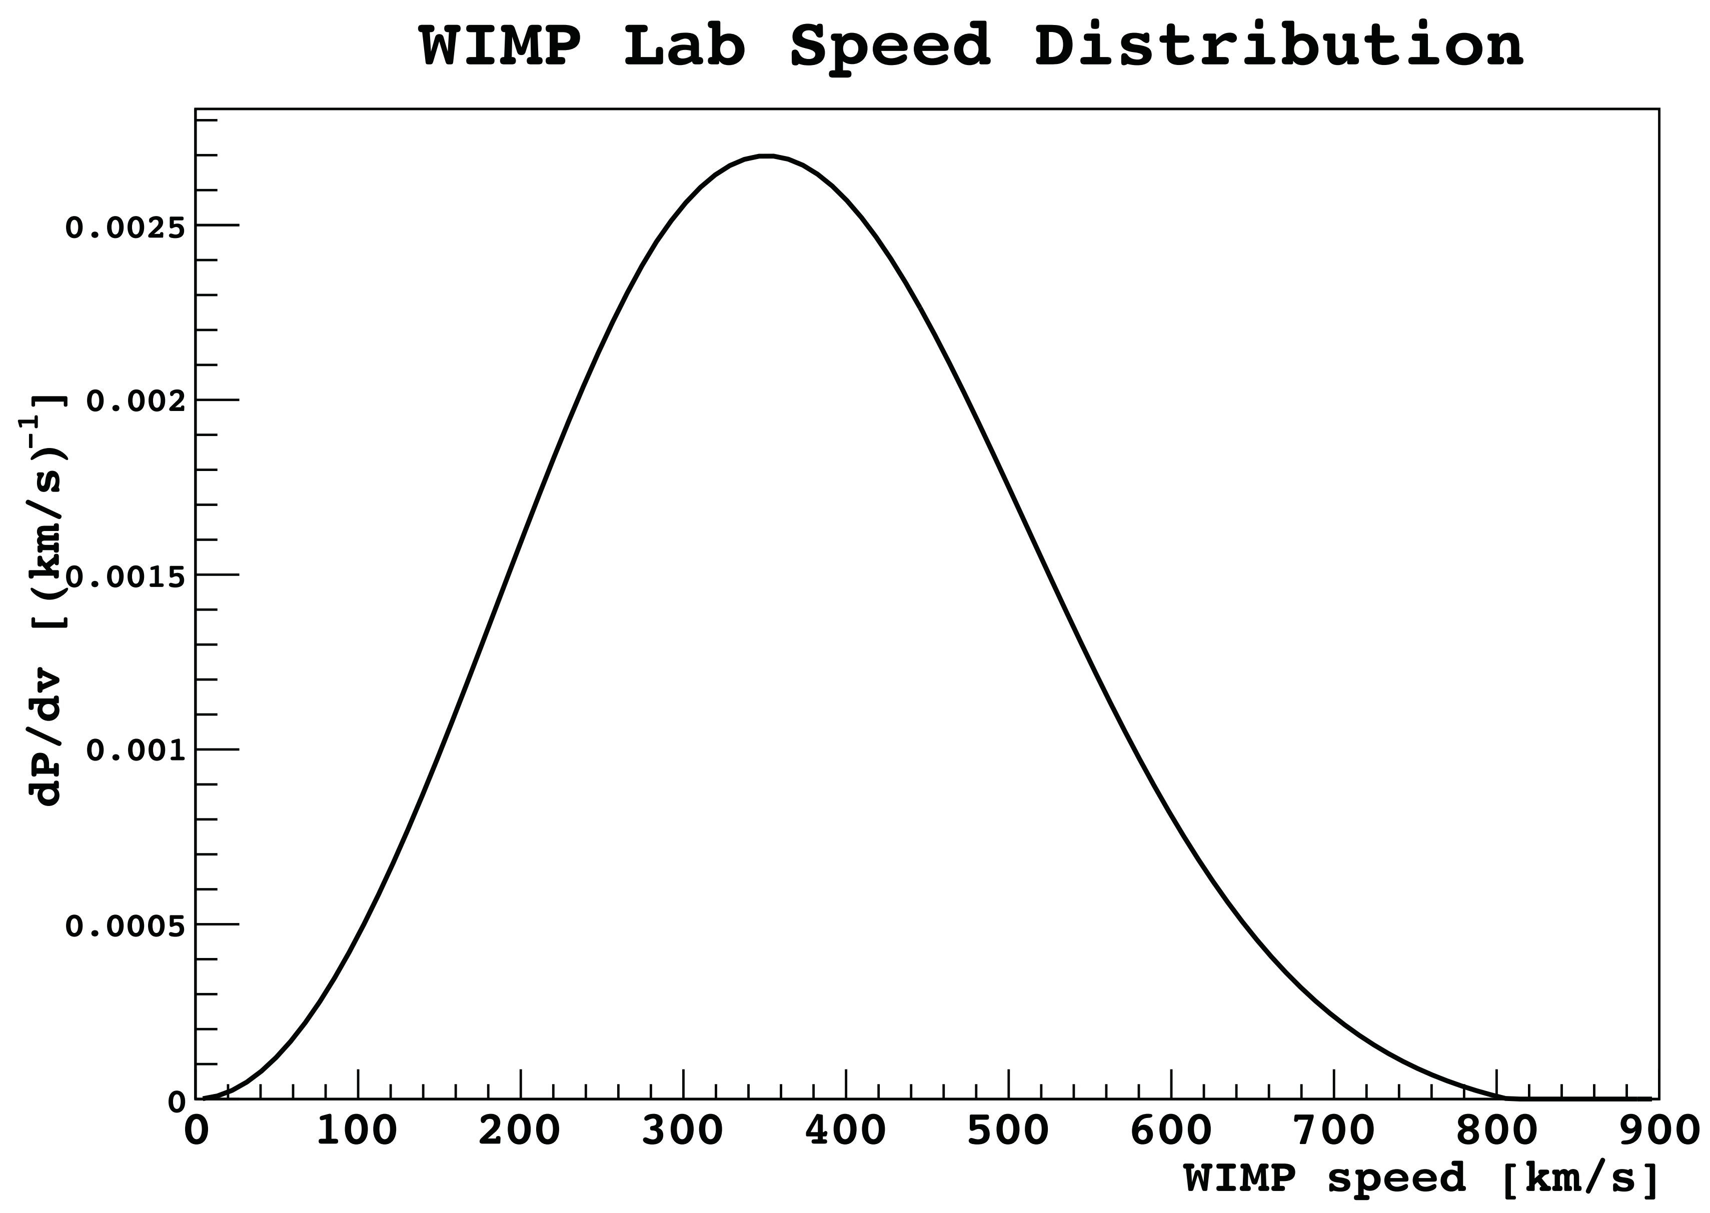
Parallel Session 1A

Monday 2022/07/18 Afternoon

14:00	**The DAMIC-M Experiment: Status and First Results**	*Danielle Norcini*	*EI7*	14:00 - 14:20
	The low-energy spectrum in DAMIC at SNOLAB	*Alvaro Chavarria*	*EI7*	14:20 - 14:40
	SENSEI: Sub-GeV Dark Matter Search with Skipper CCDs	*Mariano Cababie*	*EI7*	14:40 - 15:00
15:00	**The Oscura experiment – searching for low-mass dark matter with a very-large array of skipper-CCDs**	*Nathan Saffold*	*EI7*	15:00 - 15:20
	First 100 eV nuclear recoil ionization yield measurement in silicon	*Dr Valentina Novati*	*EI7*	15:20 - 15:40
	Measurement of low-energy Compton and neutron scattering in Si CCDs for dark matter searches	*R Smida*	*EI7*	15:40 - 16:00
16:00				
	Sub-GeV Dark Matter Searches with EDELWEISS: New results and prospects	*Hugues LATTAUD*	*EI7*	16:30 - 16:50
17:00	**Overview of the SuperCDMS SNOLAB Experiment**	*Matthew James Wilson*	*EI7*	16:50 - 17:10

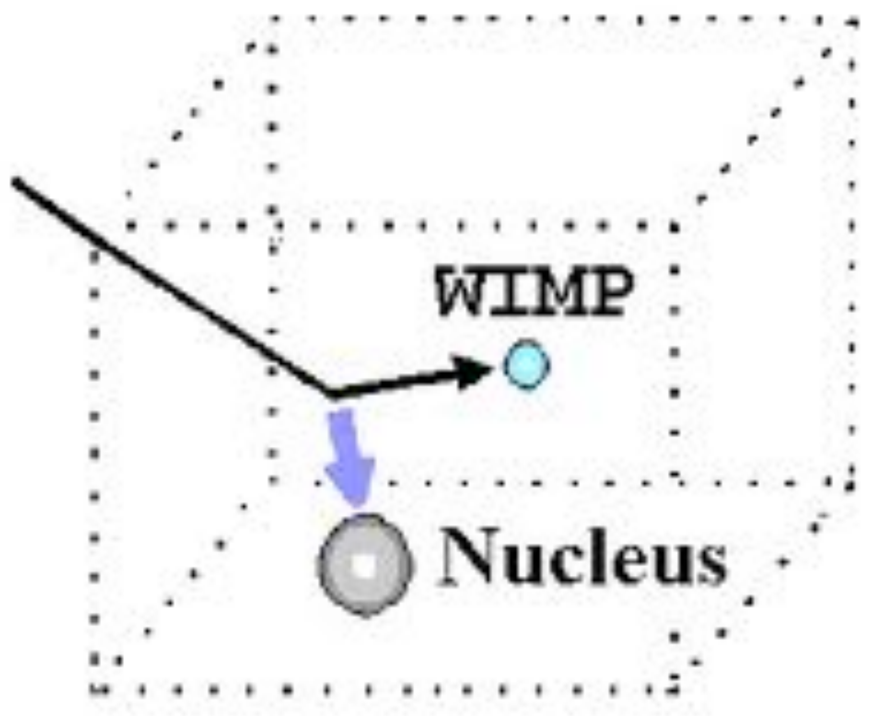
Dark matter signal

- Local density in ~0.3 GeV c^{-2} cm^{-3}.
- Interaction cross-section is small.
- Dark matter is cold, kinetic energy is ~10^{-6} Mc^2.
- Need detector with low energy threshold, largest possible exposure and correspondingly low backgrounds.



Traditional mechanism for WIMP searches:

Coherent enhancement: $\sigma_N \propto A^2$

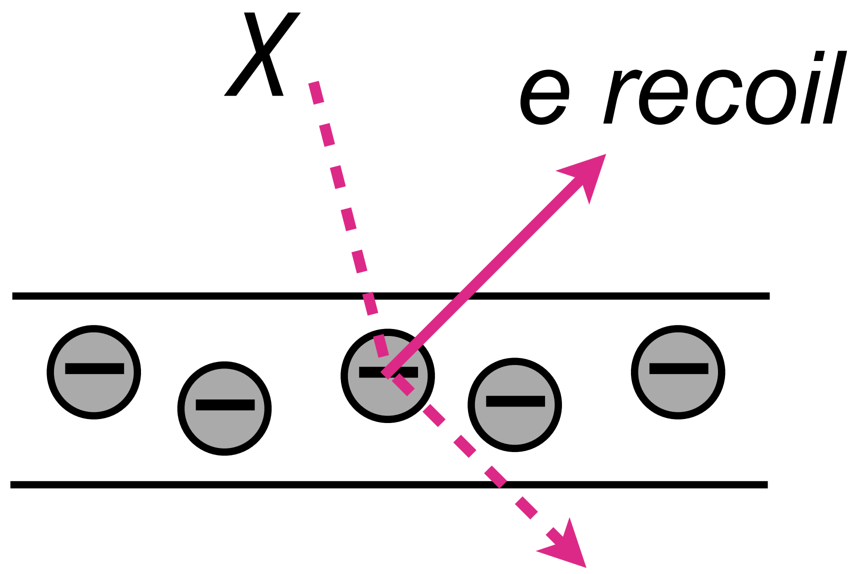


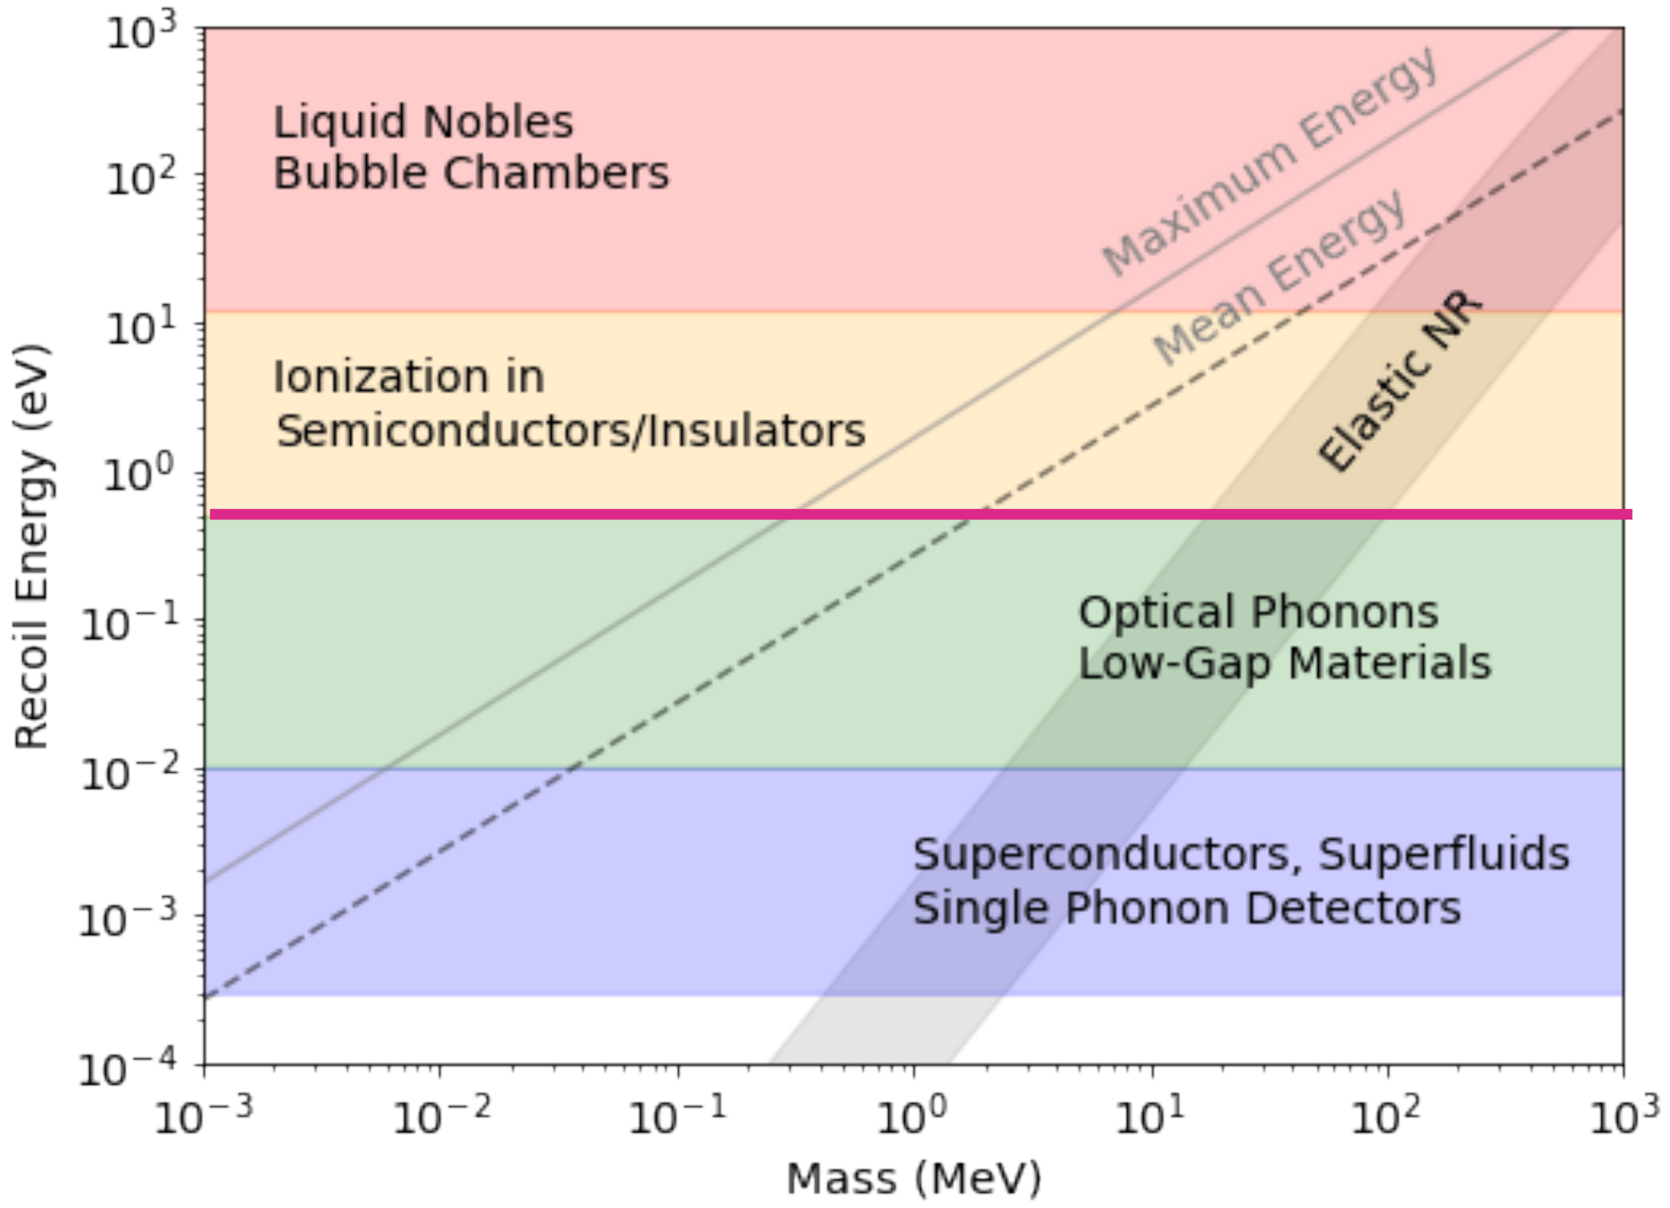
For low-mass WIMP: $M_T \gg M_\chi$

$$E_T < 4\frac{M_\chi}{M_T}E_\chi$$

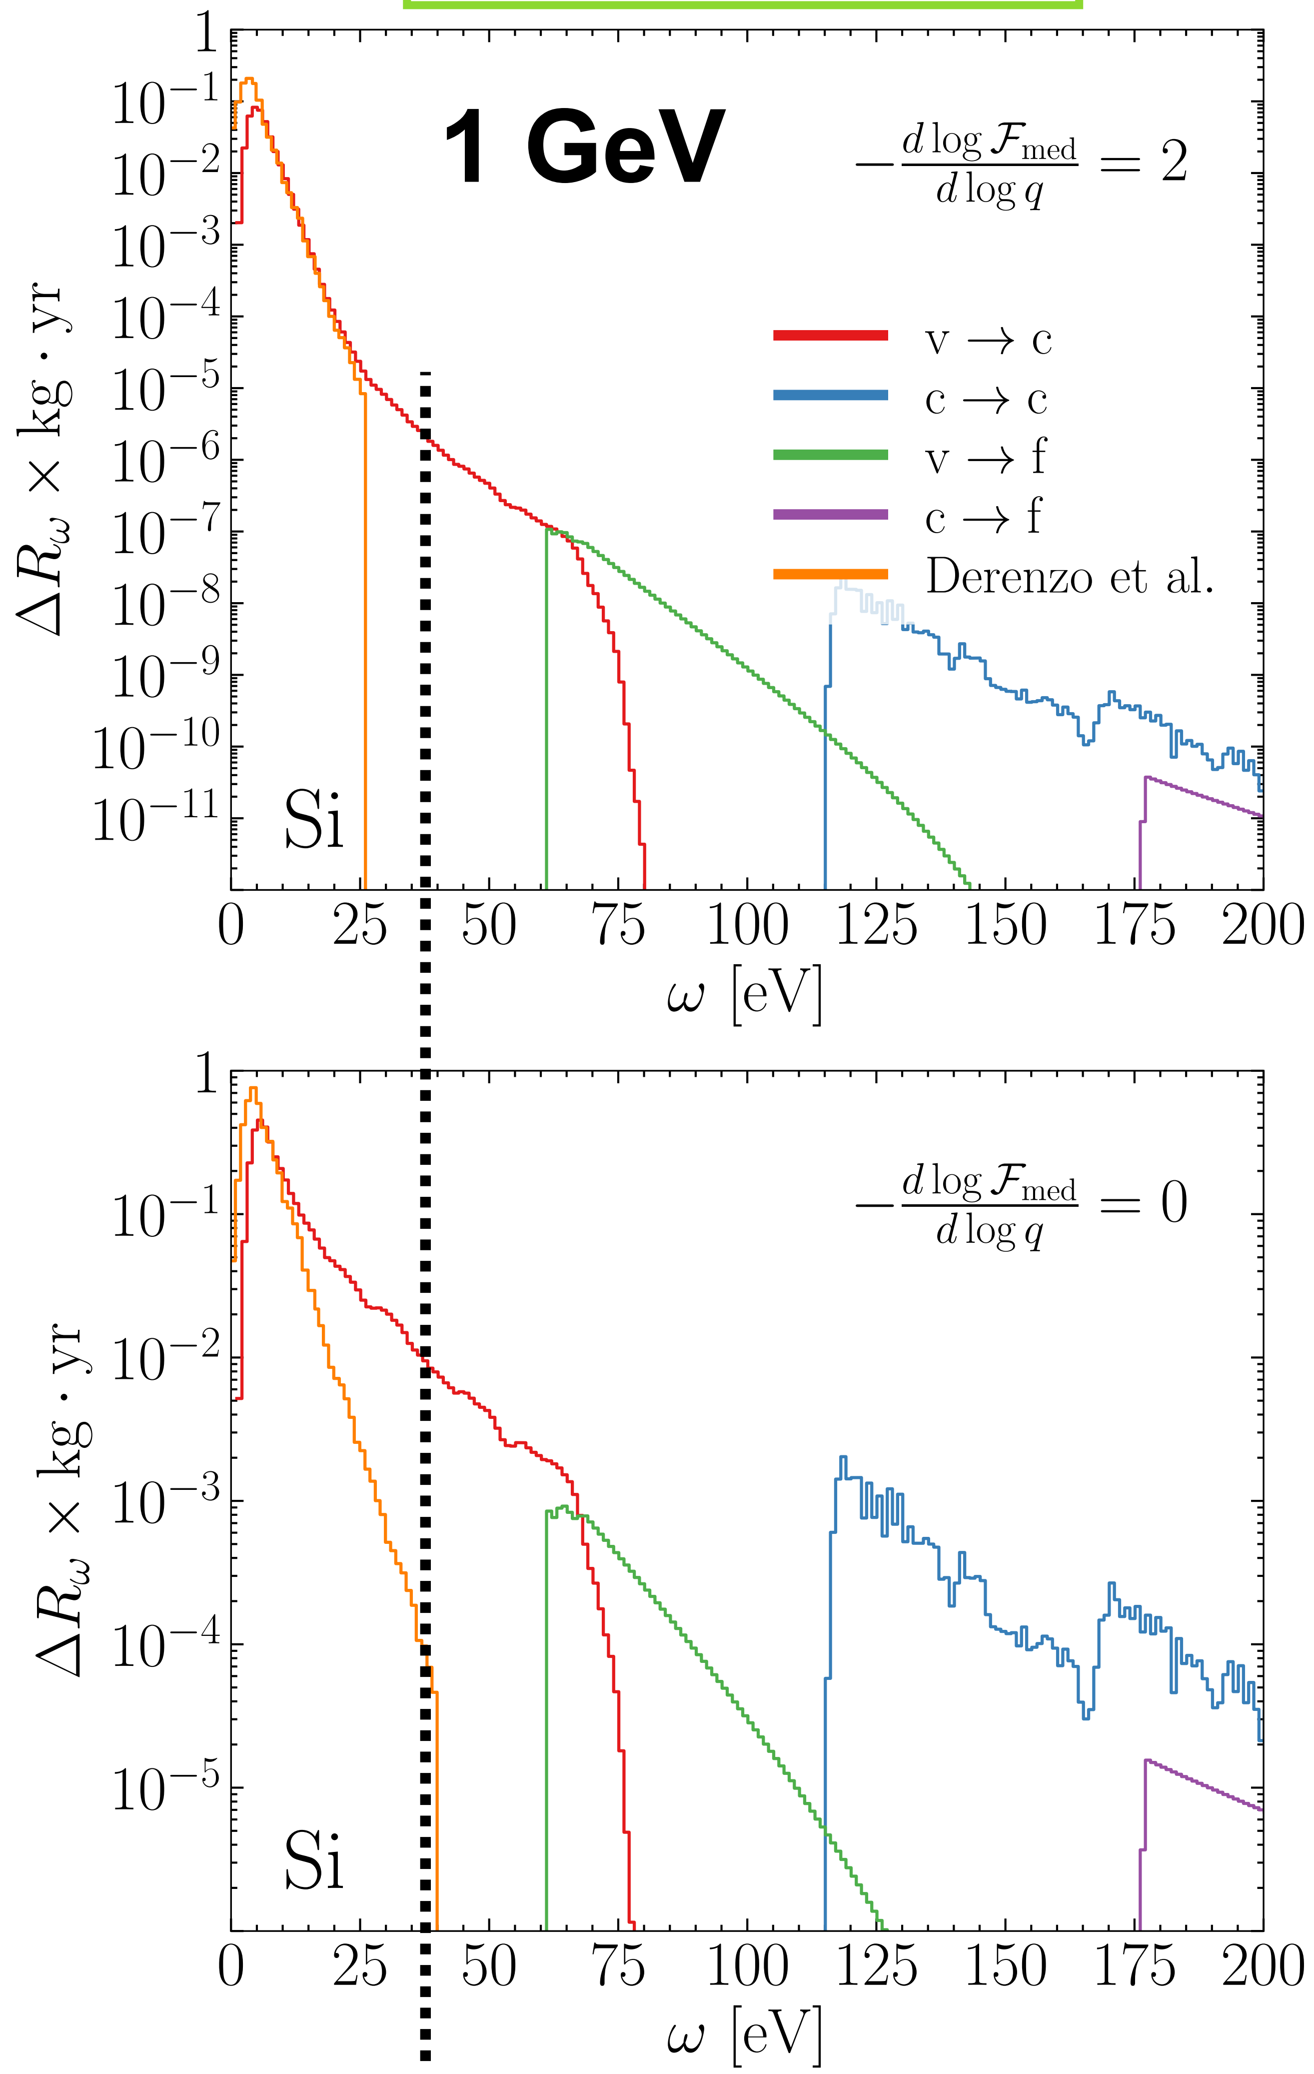
DM-e scattering

- Electrons are a lighter target and *ER visible as ionization*.
- Electrons bound with some momentum; there is a region of phase-space where the electron carries most of the WIMP kinetic energy.





PRD104(2021)095015

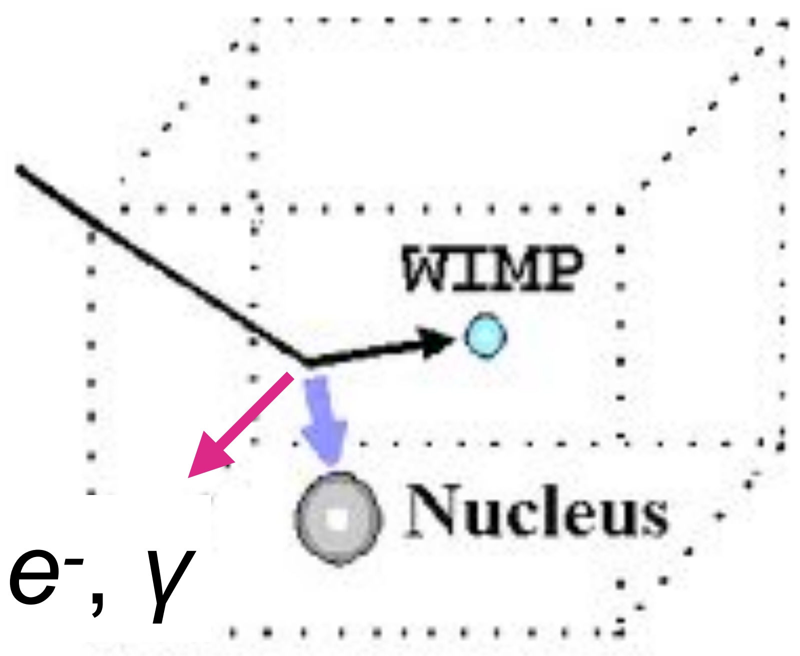


10 e^-

- Momentum distributions in some targets better “kinematically matched” to the DM than others.
- Phase-space ‘penalty,’ no coherent enhancement and probing DM-e interaction cross-section.

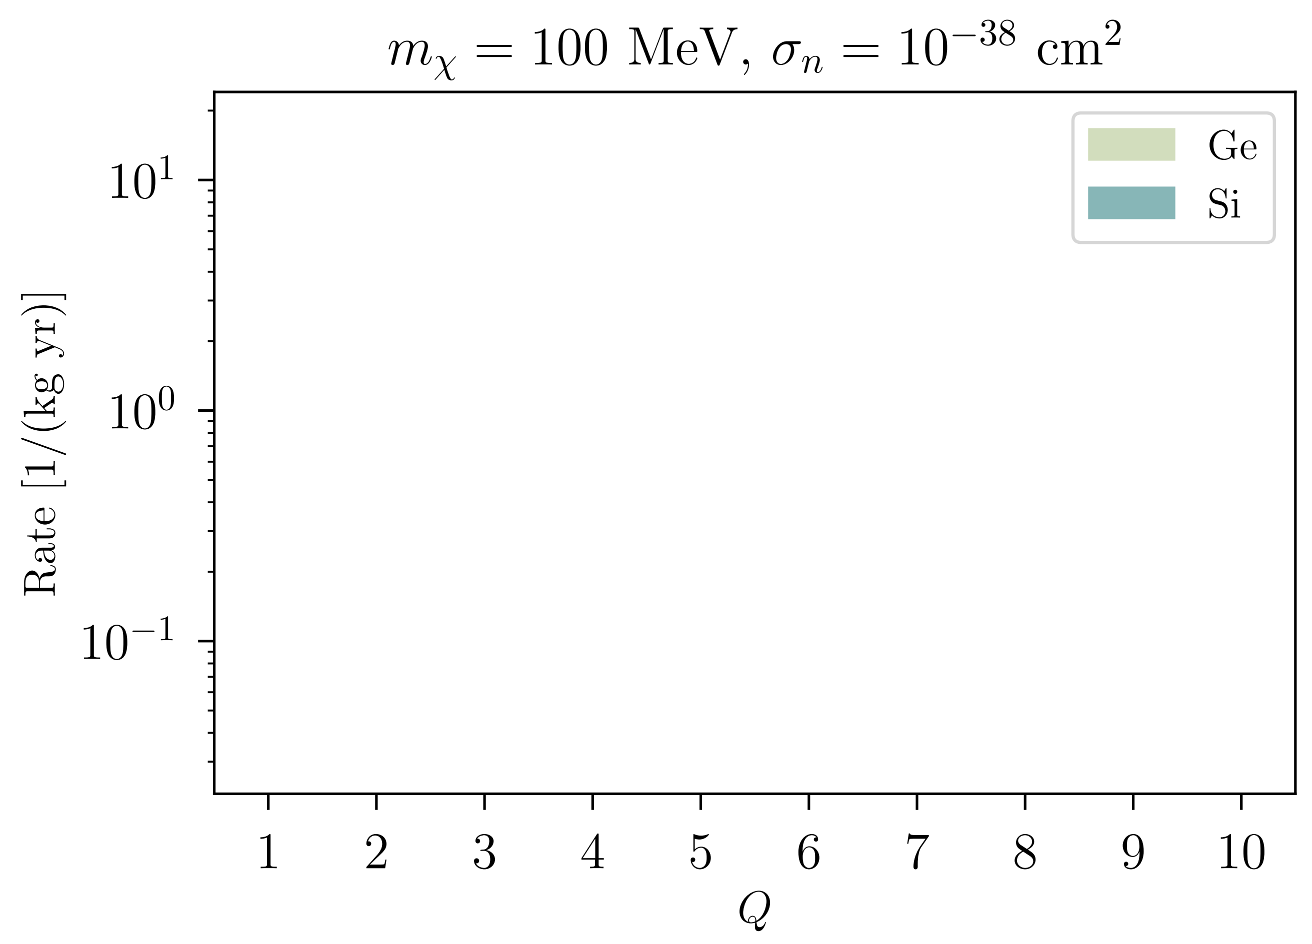
Other e-recoils

Three-body final state:



- An additional e^- or γ in the final state.
- Migdal effect (atomic e^-) or Bremsstrahlung (γ).
- *E* and *p* can be conserved even when e^- or γ take most of the WIMP kinetic energy.
- Probability of e^- or γ emission <10^{-6}. Rare.
- Never observed for recoils with keV energies. Uncalibrated.

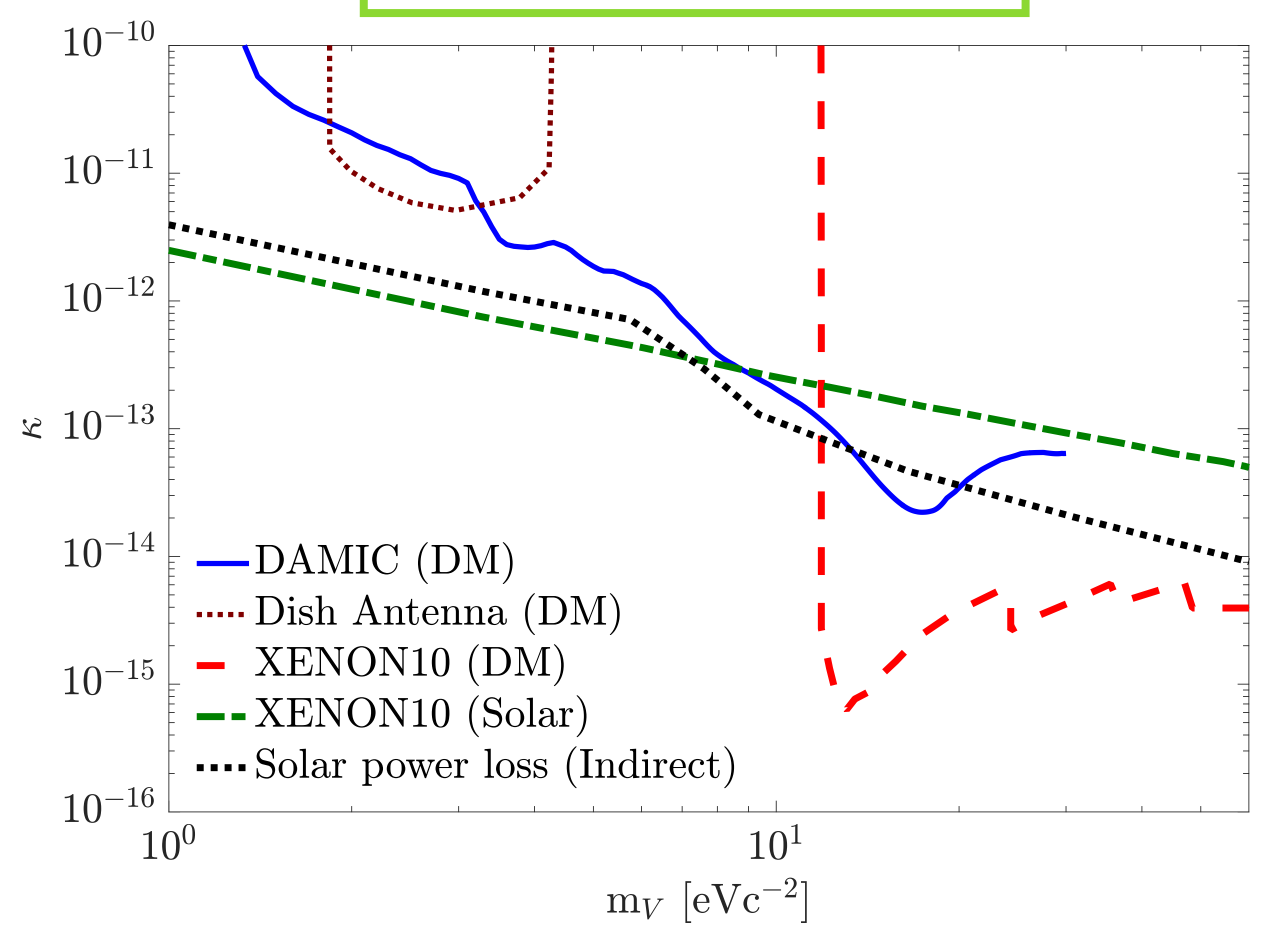
PRL127(2021)081805



Bosonic DM absorption:

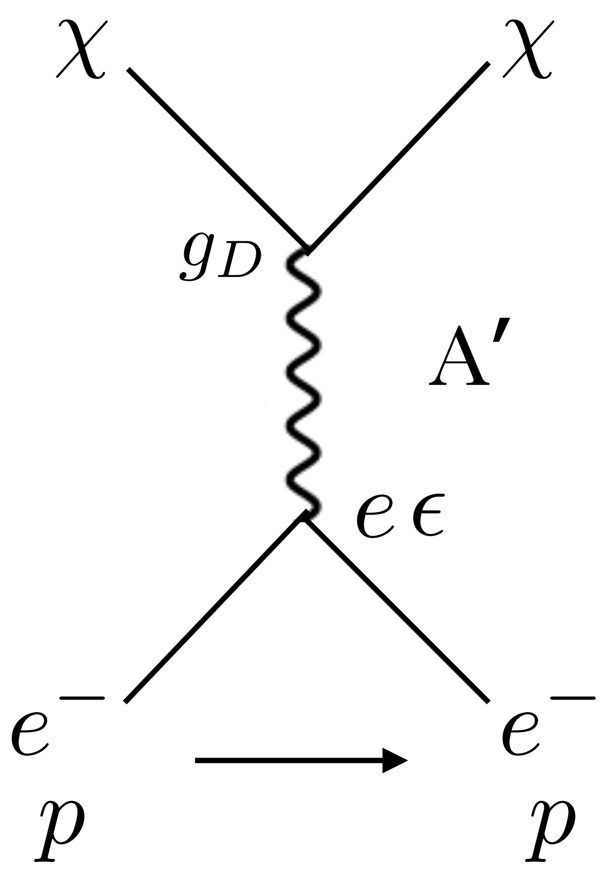
- DM particle is a boson that couples to the electron, e.g., a "dark" or "hidden" photon.
- DM is absorbed by the target electron and its rest energy released as electronic recoil K.E.

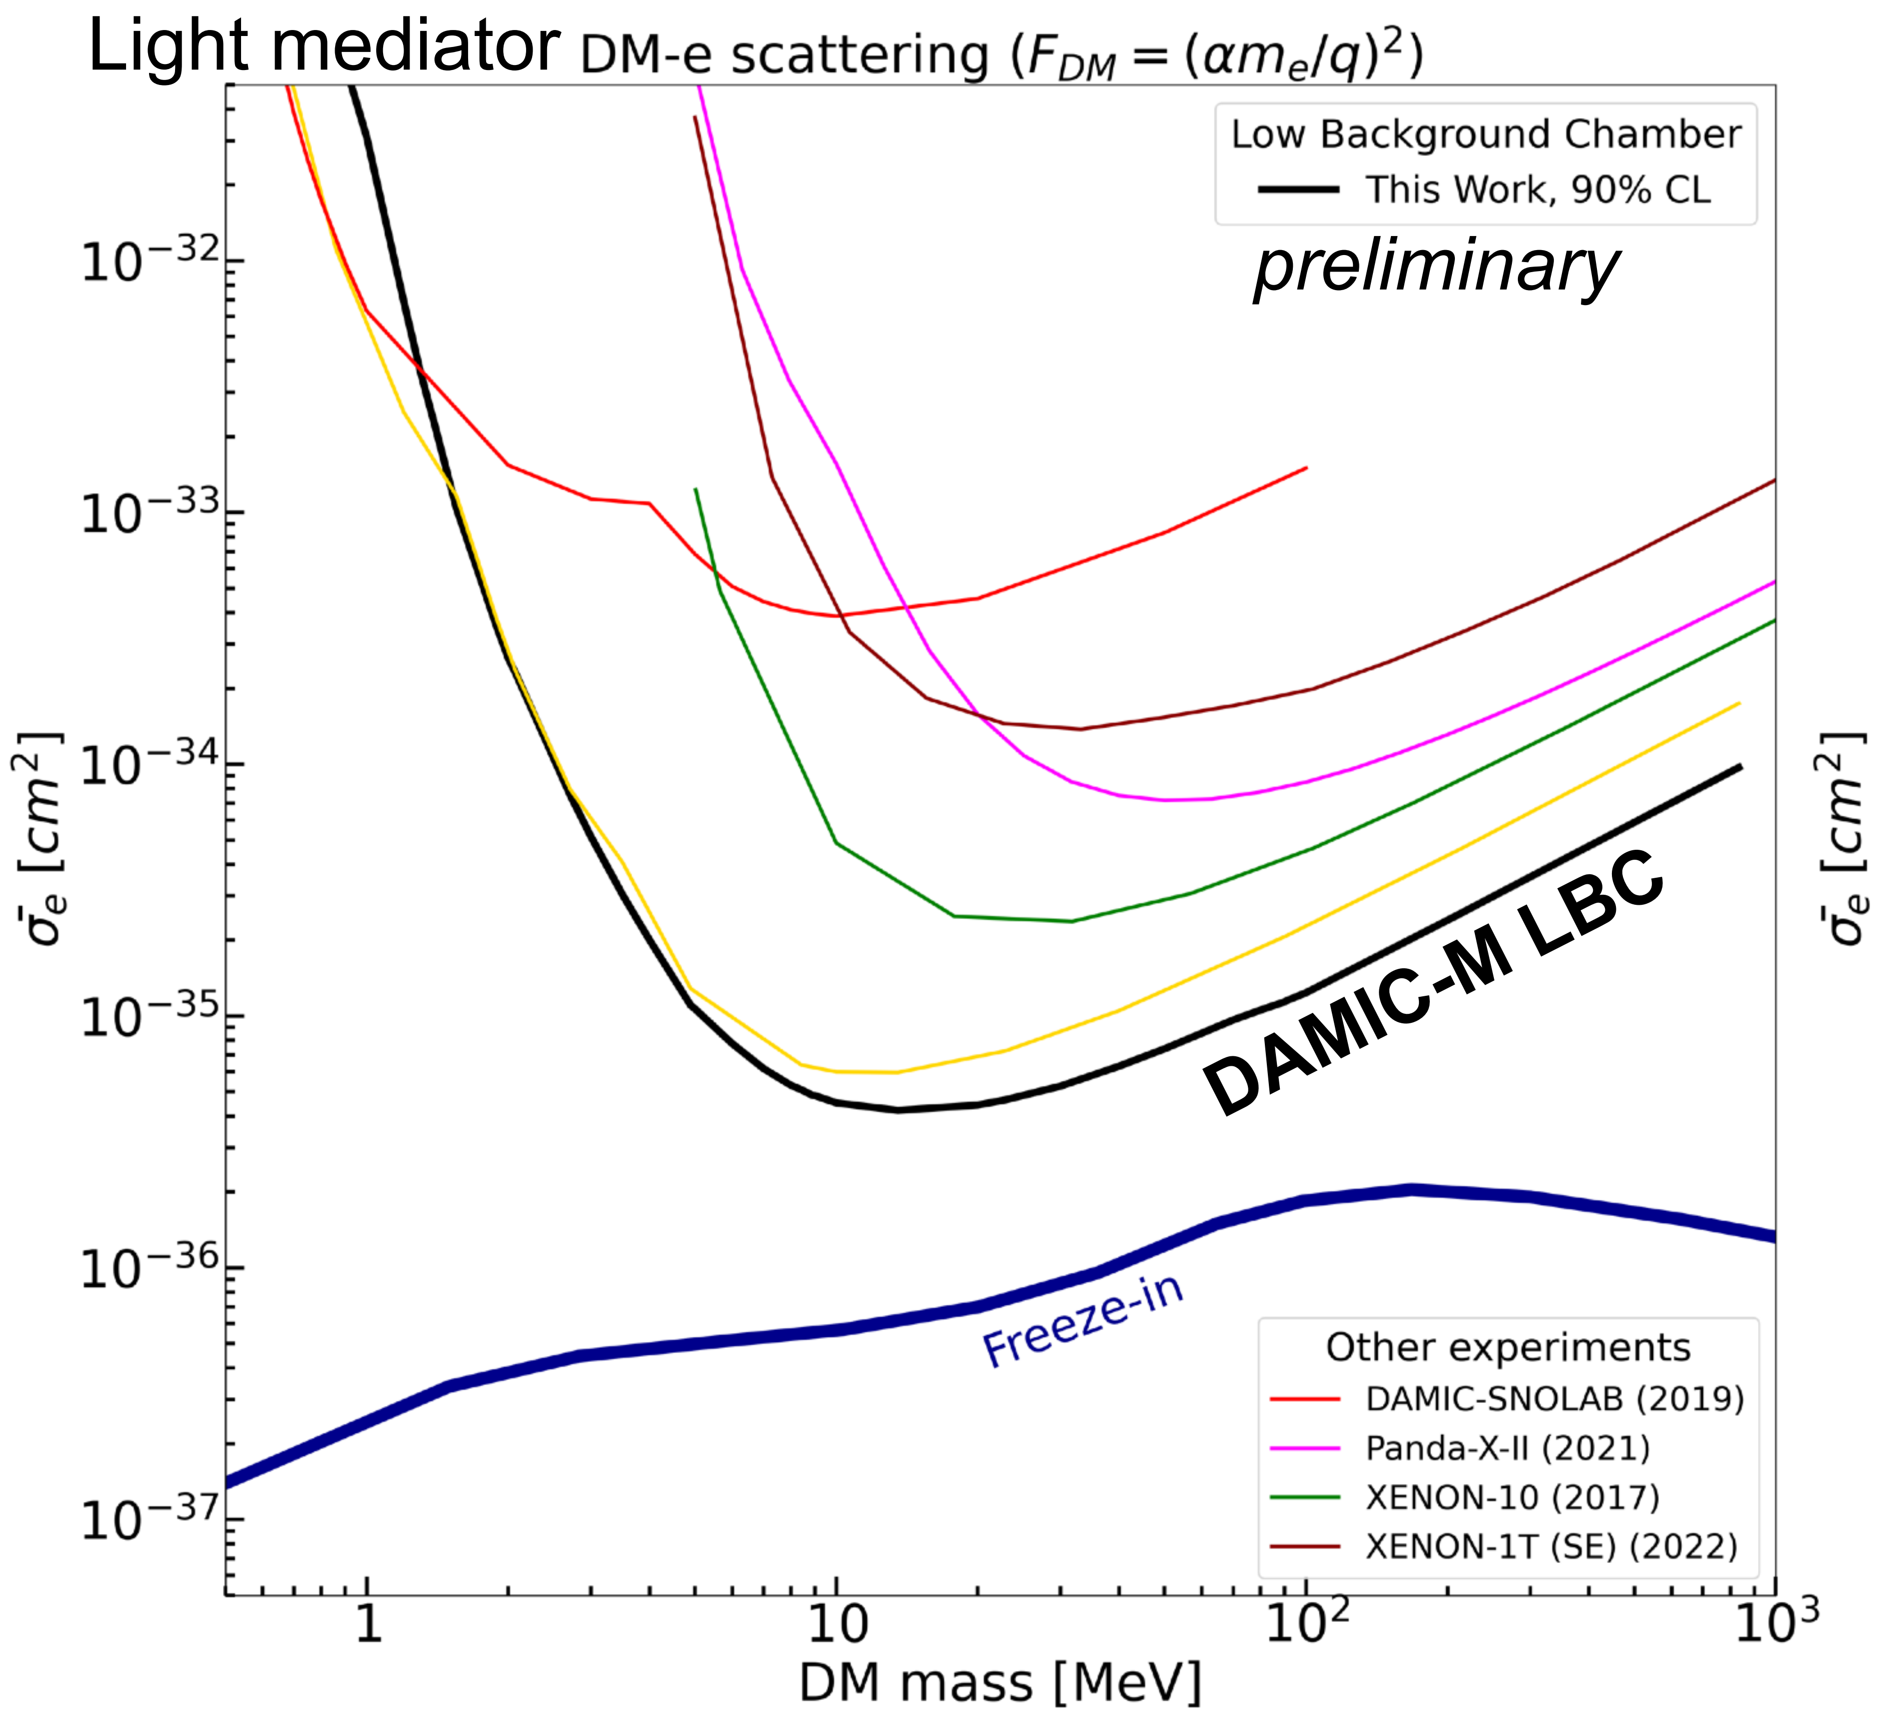
PRL118(2017)141803

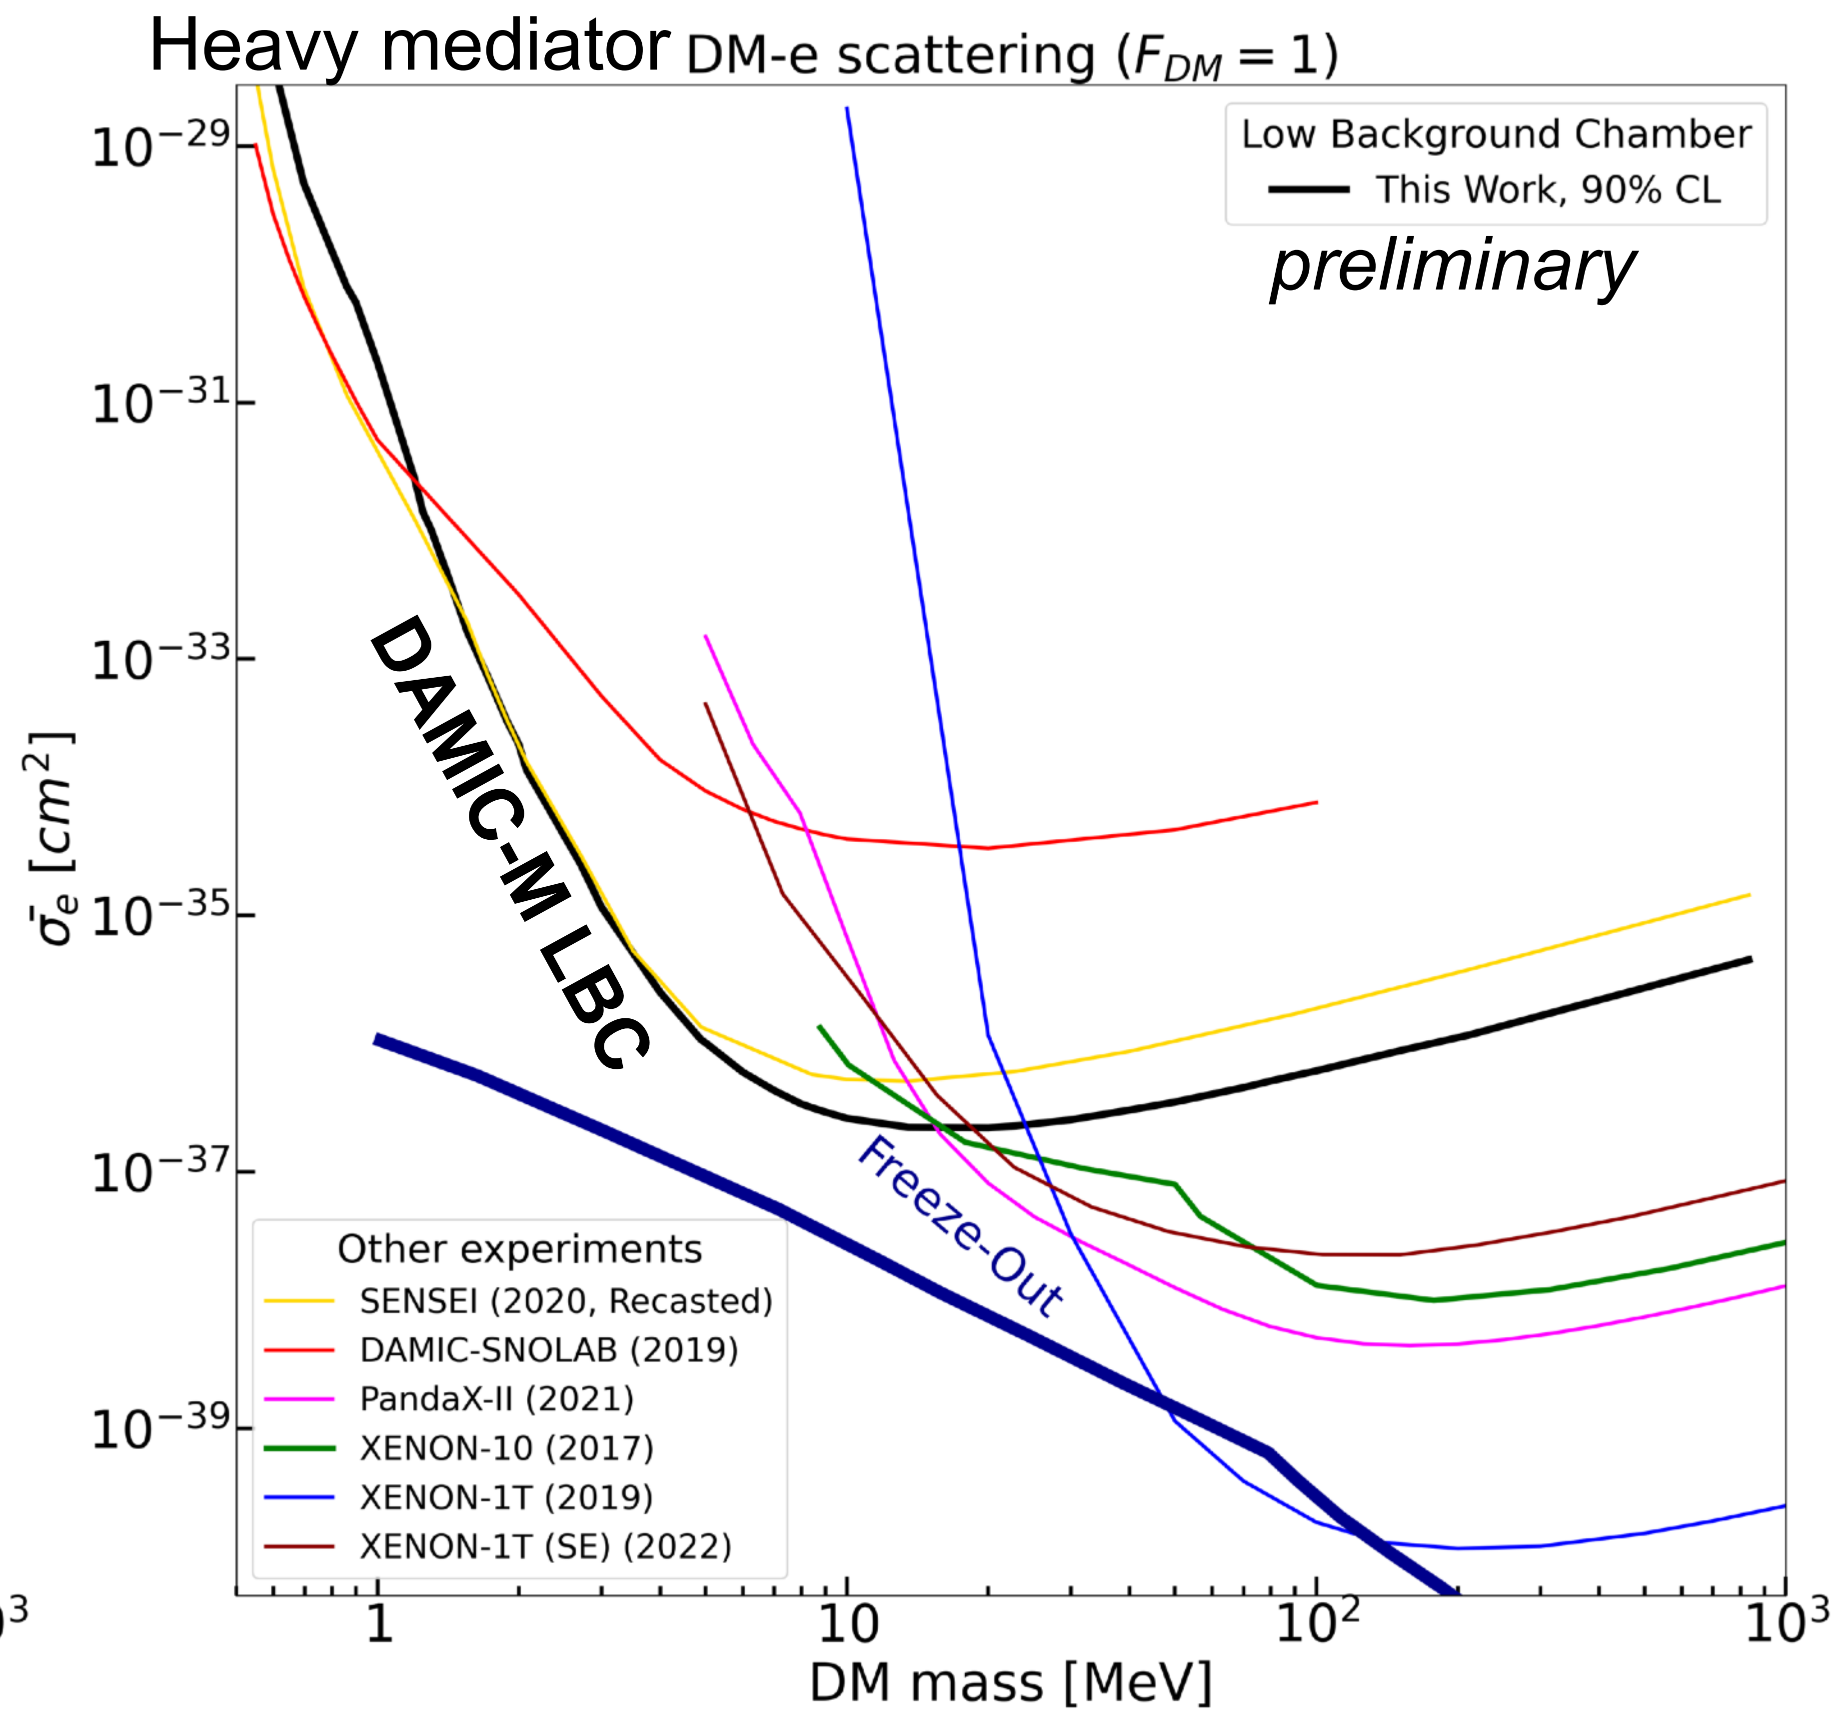


Electronic recoil result could also be interpreted as limit on DM-N scattering (Migdal) or DM absorption
I will use DM-e scattering parameter space as benchmark

DM-e exclusion limits





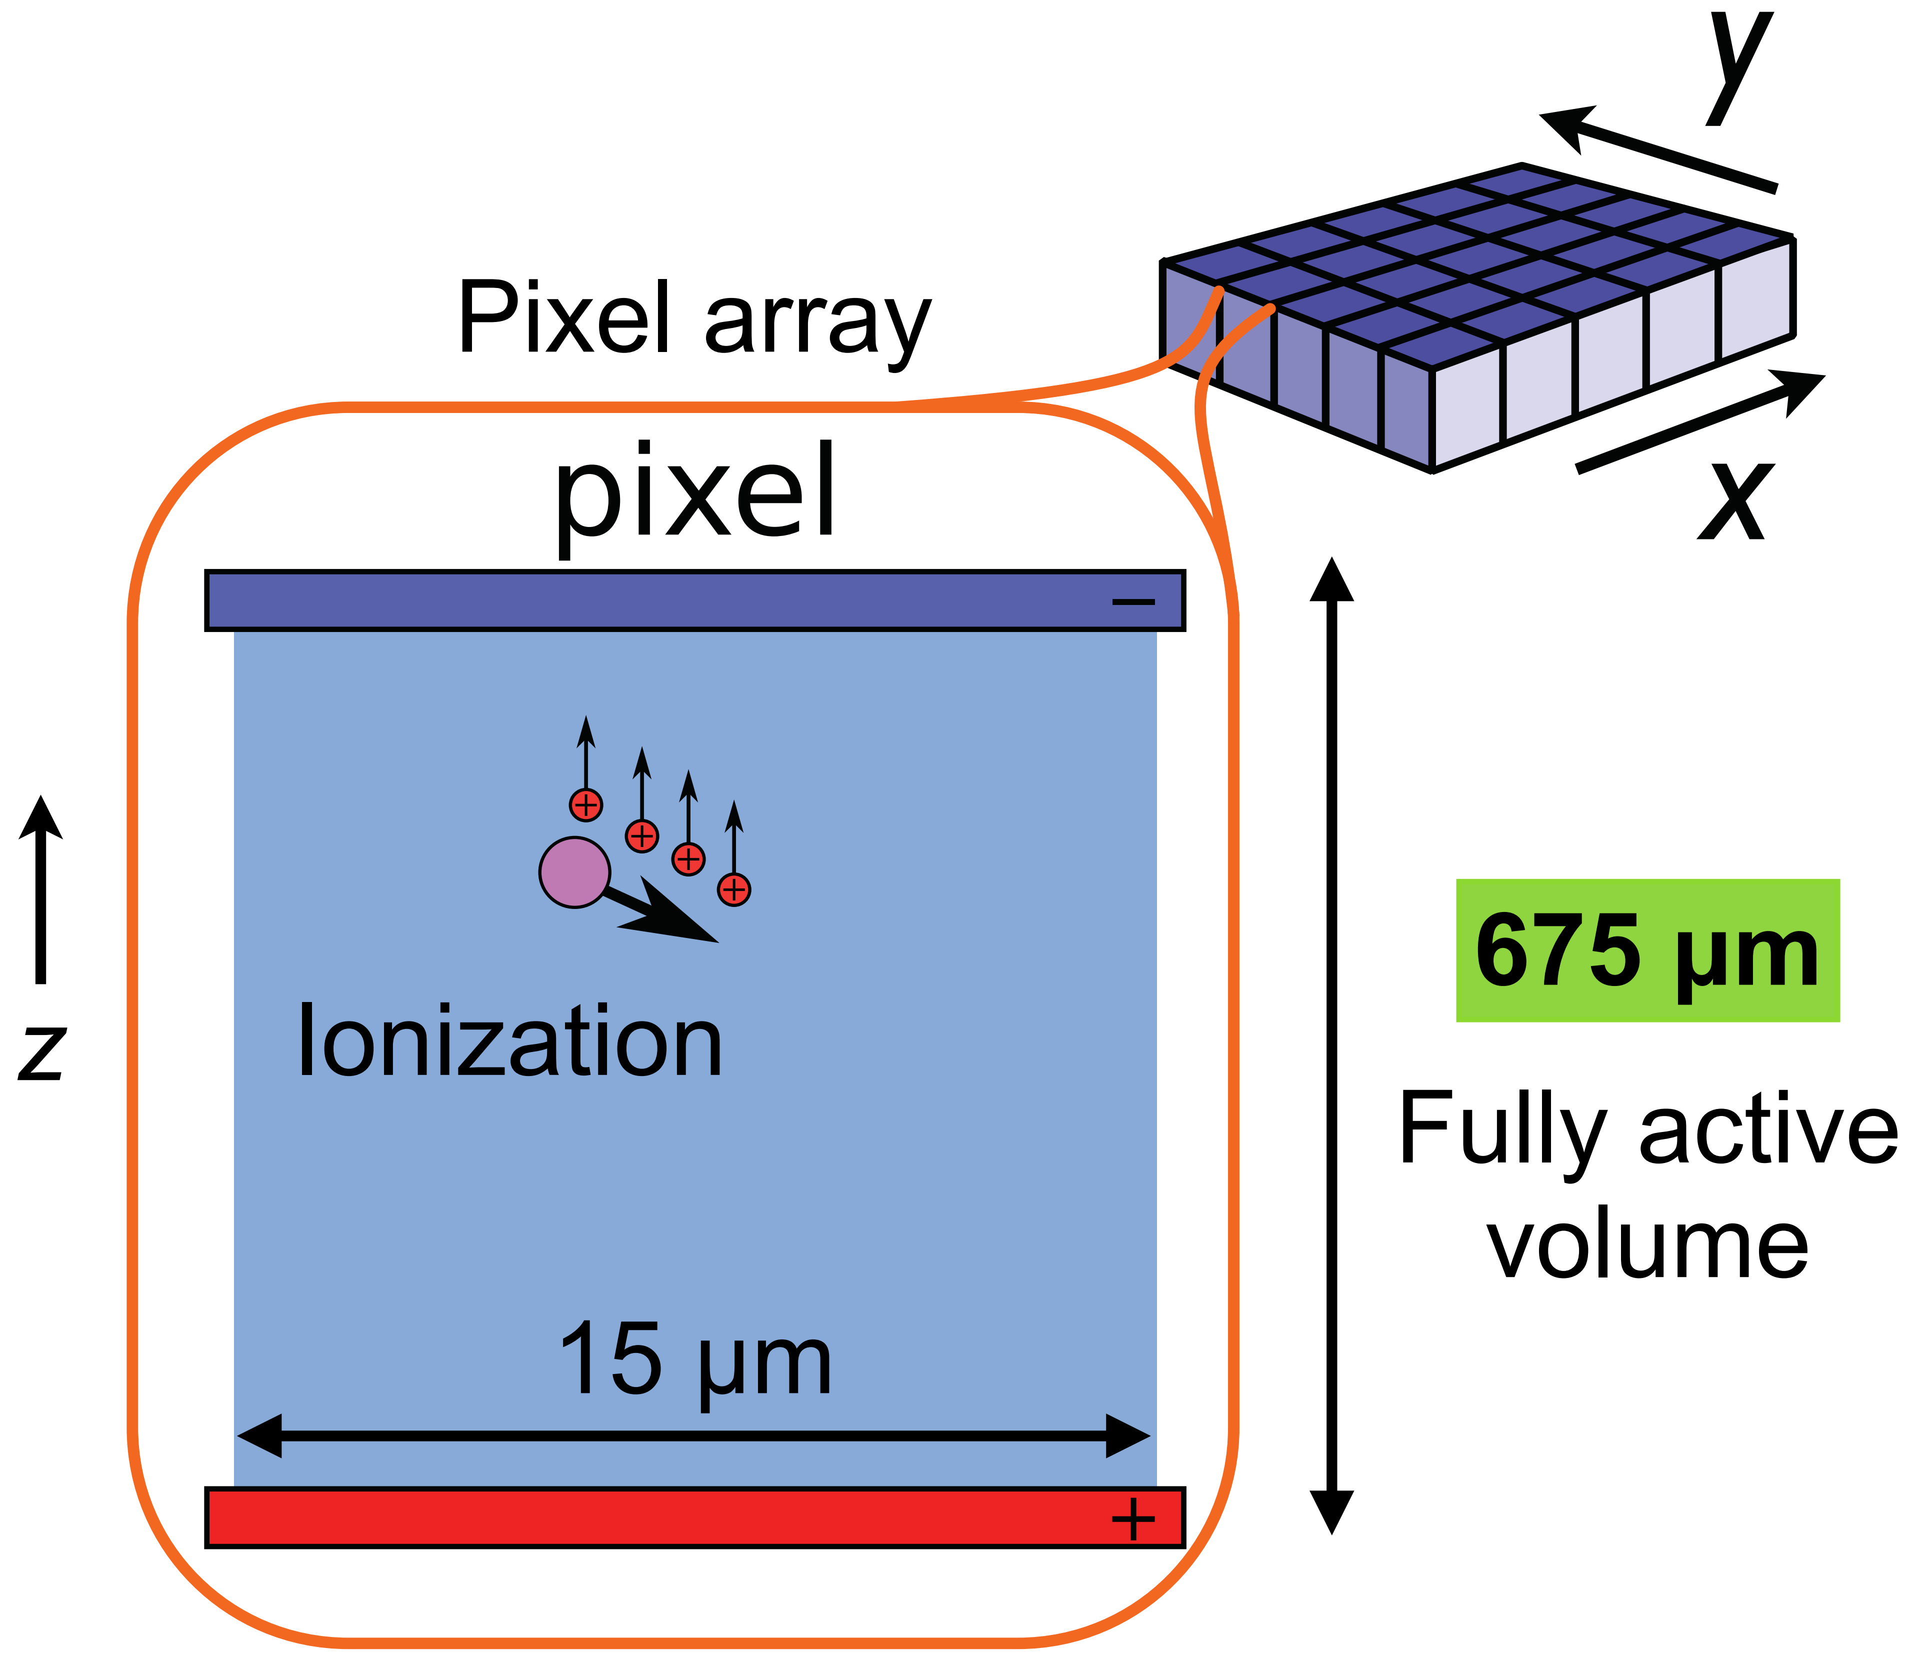


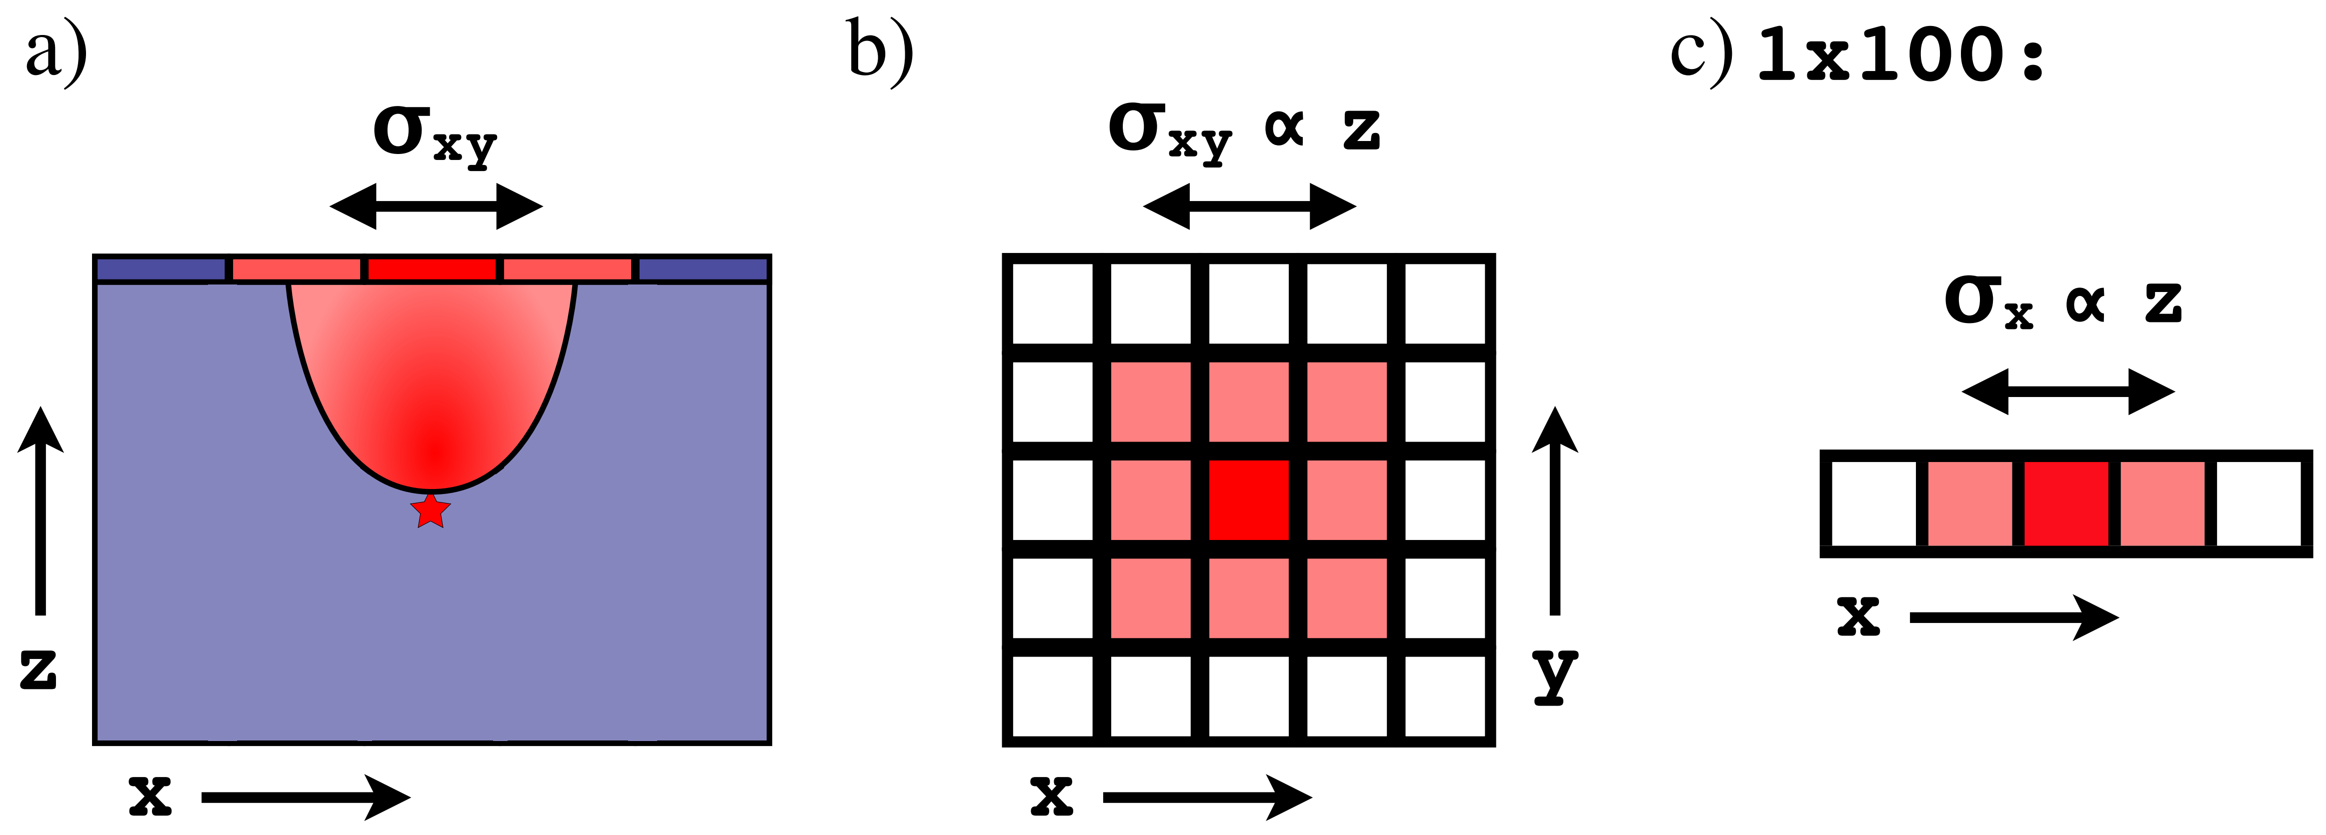
- ER searches allow us to probe DM masses as small as ~**MeV**!

- Skipper-CCD detectors have the best limits.
- **DAMIC-M LBC releases new results today.**

D. Norcini's talk

Charge-coupled devices





Silicon band-gap: 1.2 eV.
Mean energy for 1 e-h pair: 3.8 eV.

- Depth (z) reconstructed from distribution of charge on pixel array.
- Device is “exposed,” collecting charge until user commands readout.
- Readout can be slow : **low noise (few e-).**
- Standard fabrication in semiconductor industry and easy cryogenics (~100 K).

Sample CCD image (~15 min exposure)

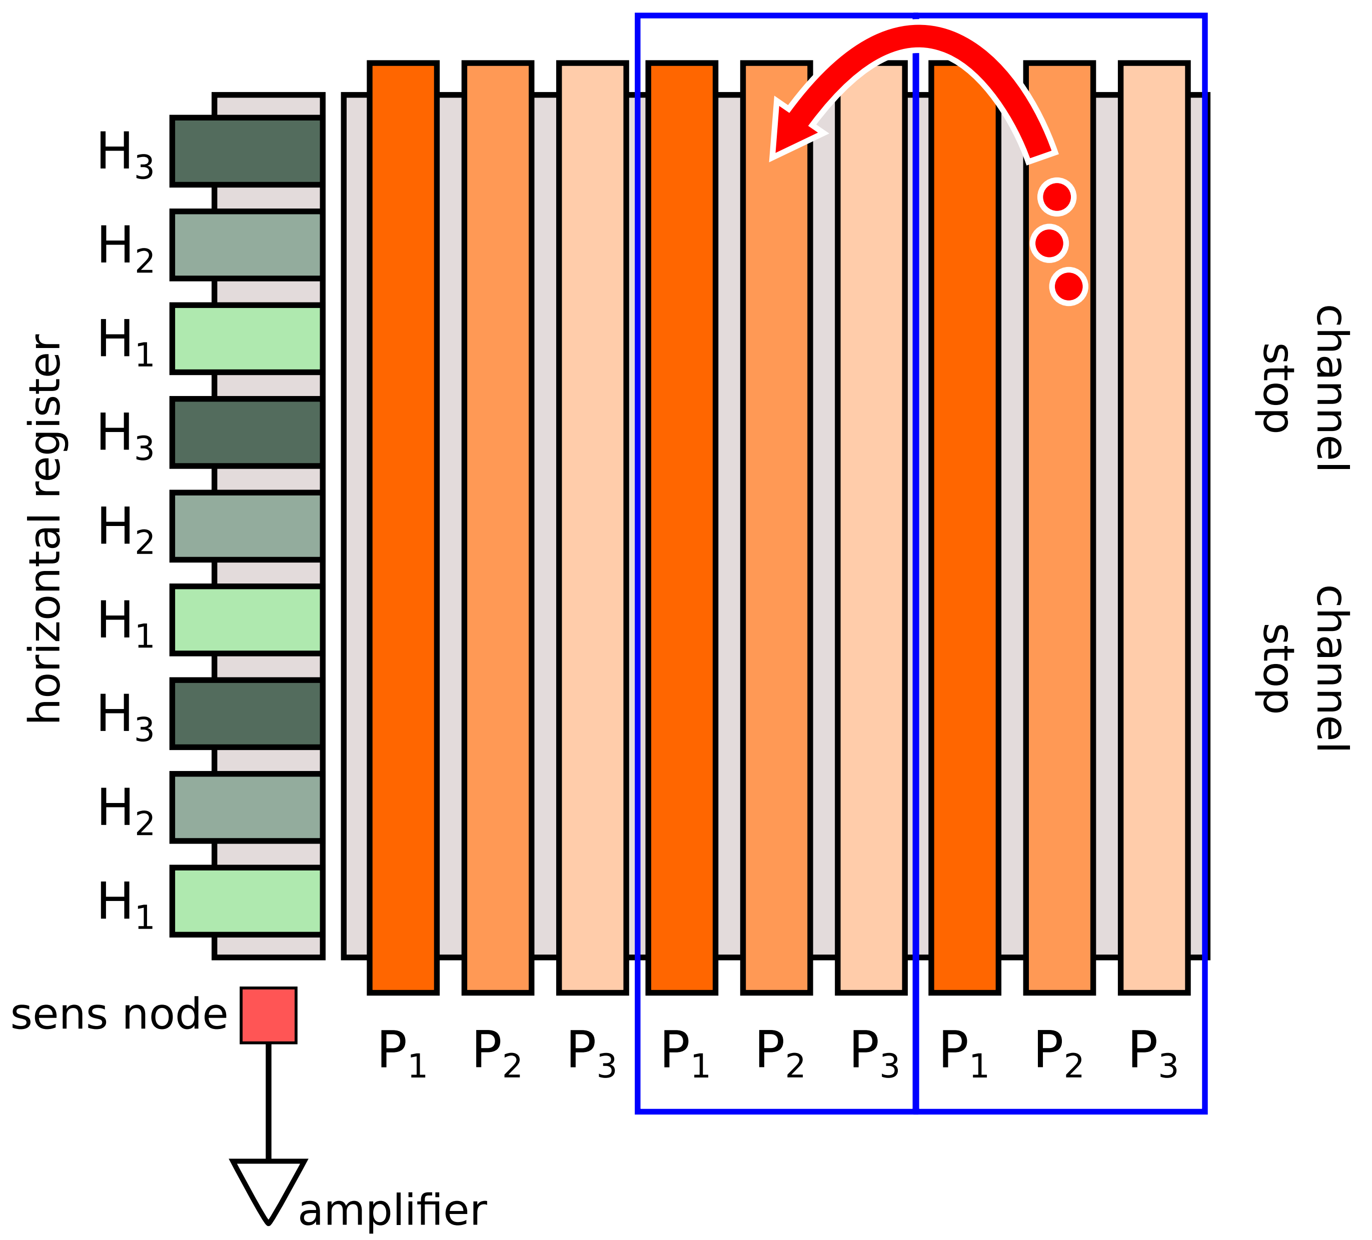
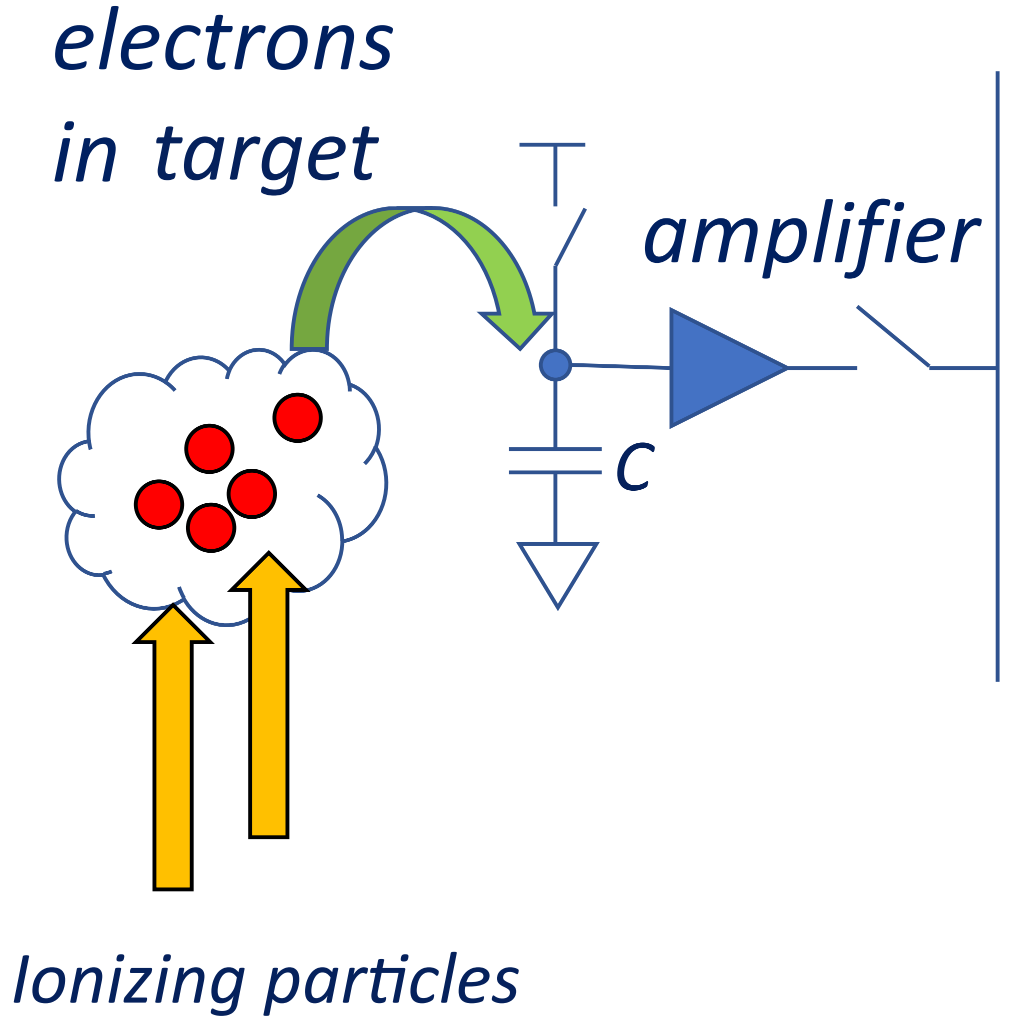
Energy measured by pixel [keV]

Readout

3x3 pixels CCD





$$\Delta V = \Delta Q / C$$

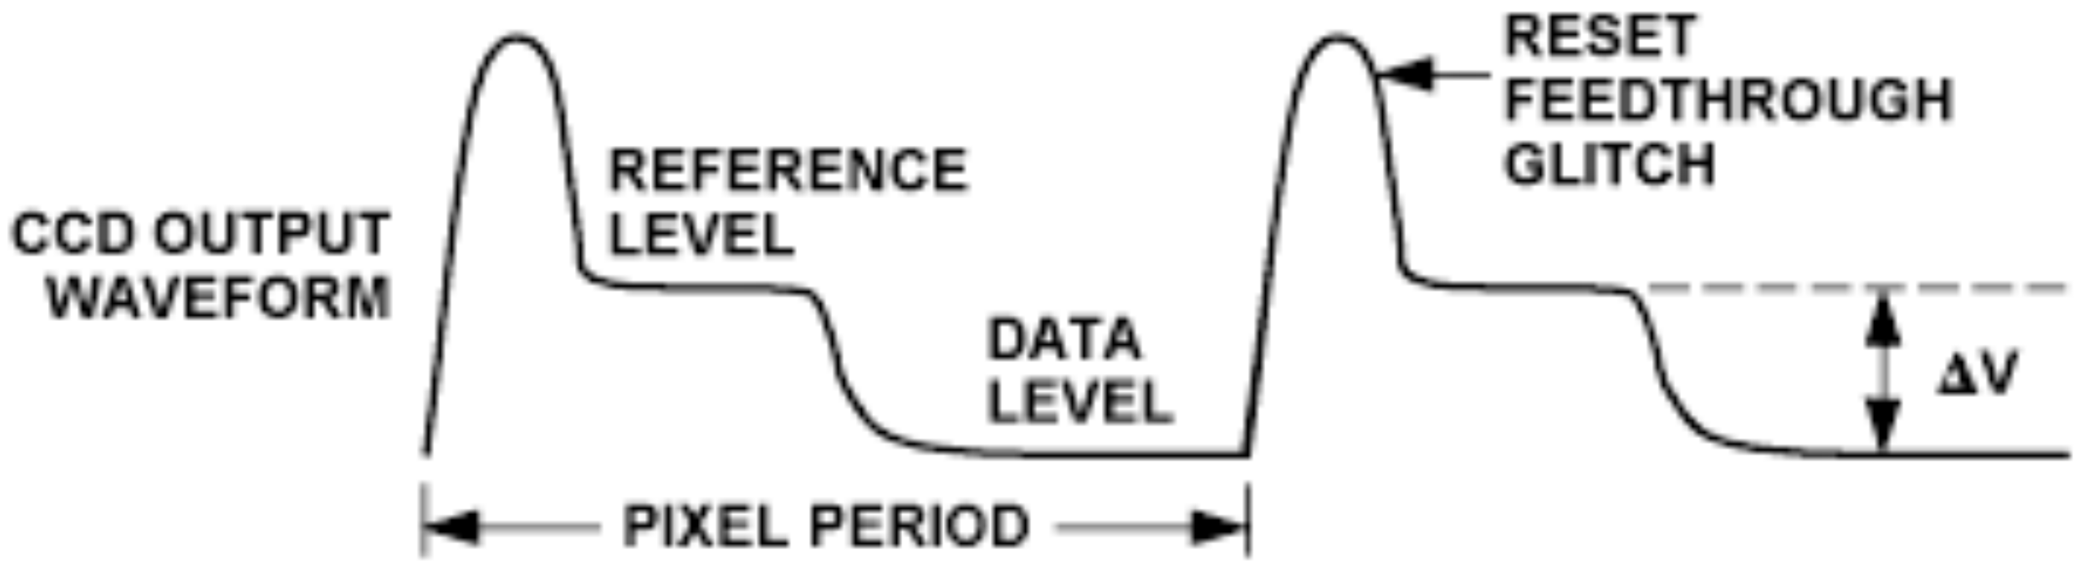
For **C ~ 10 fF**: **ΔV/ΔQ ~ 16 μV/e⁻**

Signal that you can measure

Small capacitance with ***physically* small** components, e.g., $C \propto A/d$ ~ *linear scaling* for a parallel plate capacitor.

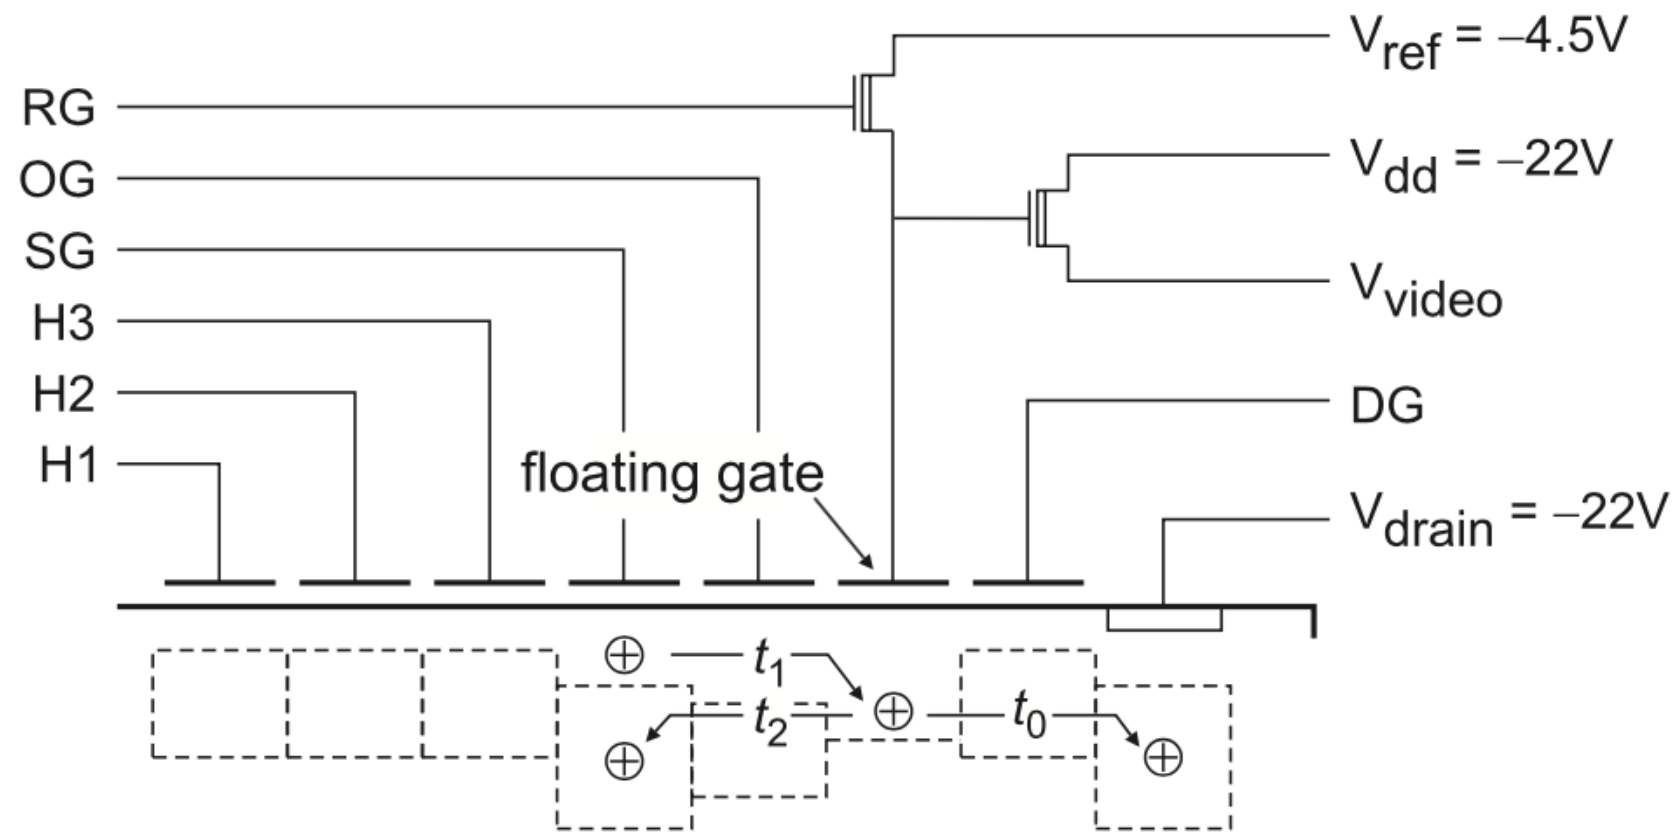
Correlated double sampling (**CDS**):

Readout strategy to efficiently filter "reset" and high frequency noise



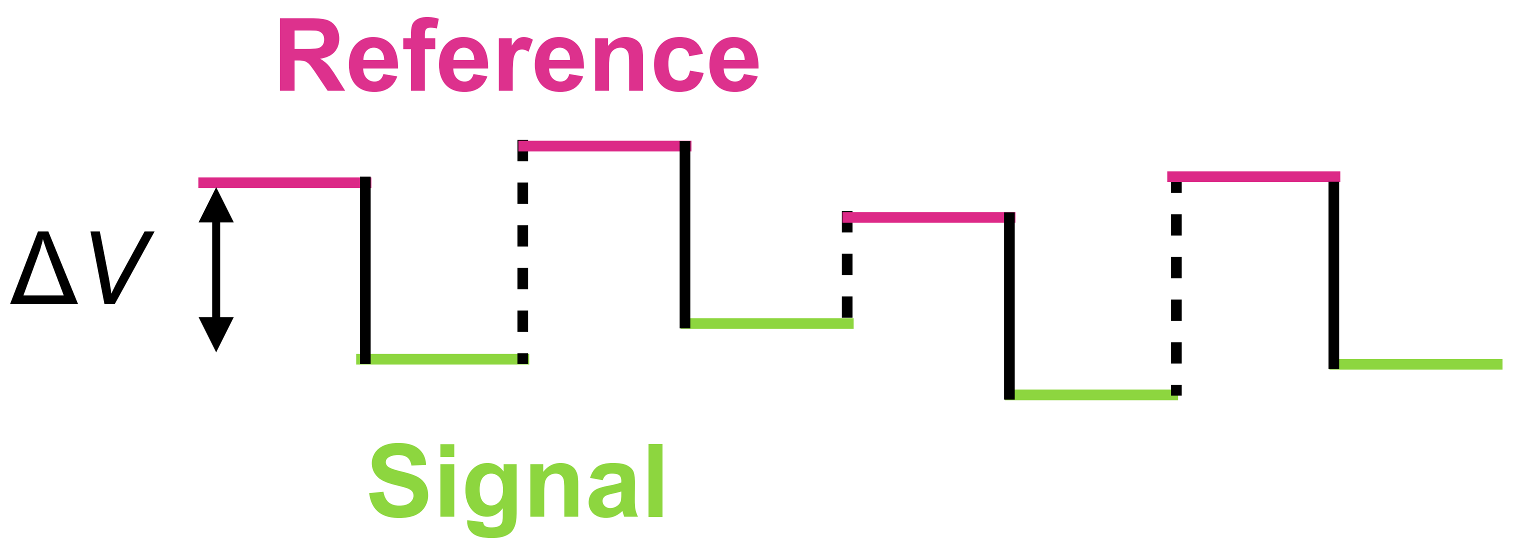
Skipper CCD

“Skipper” readout: Perform *N* uncorrelated measurements of the same pixel.

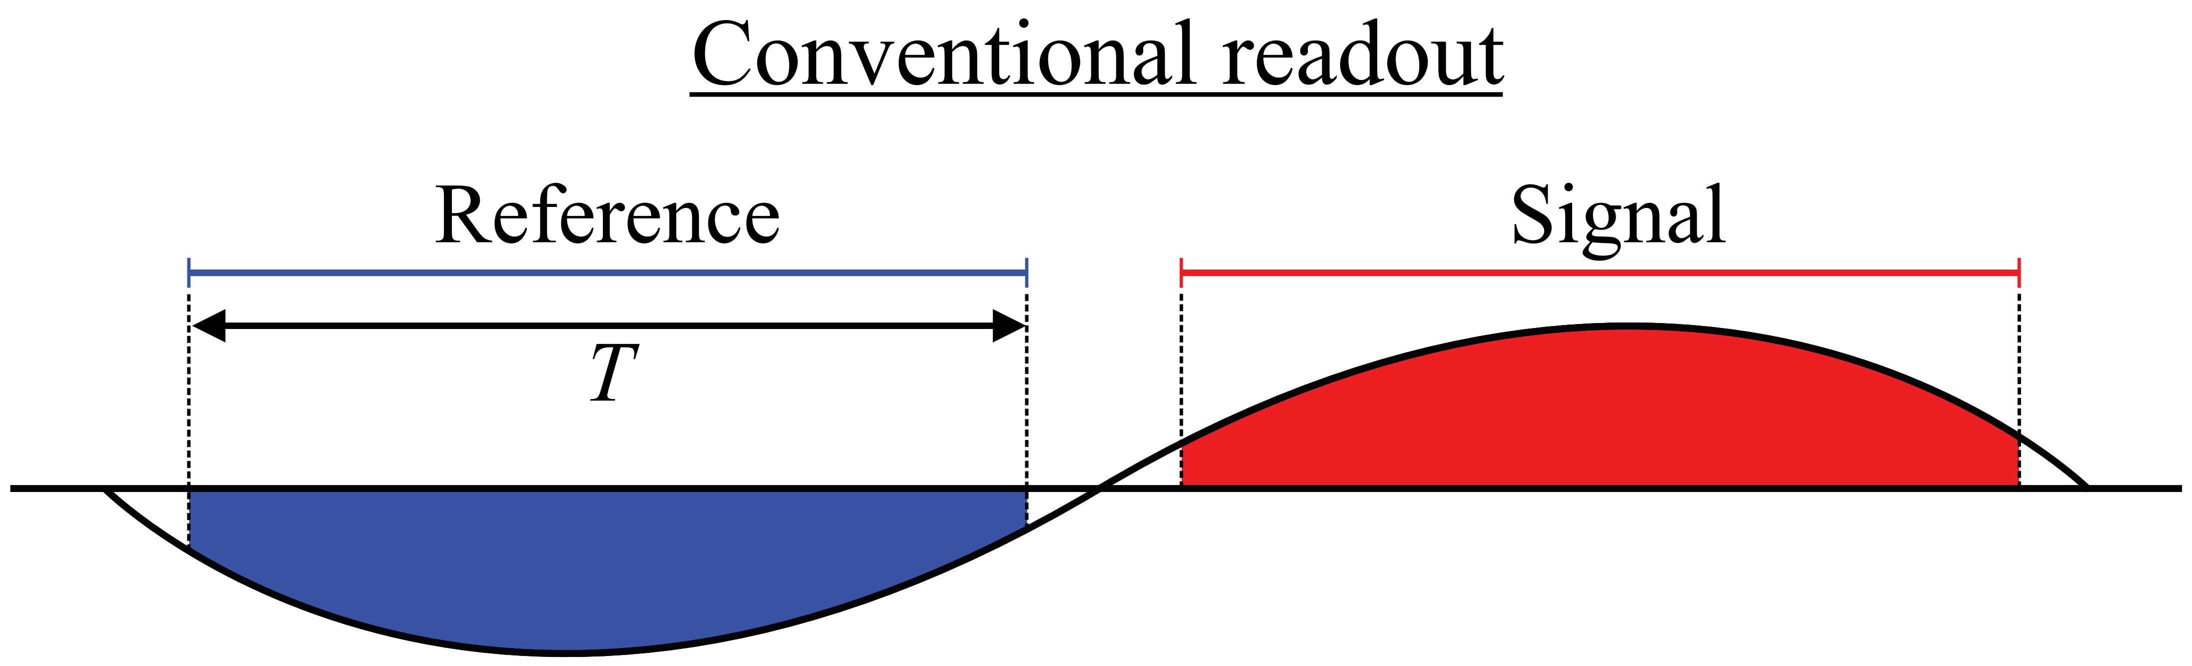


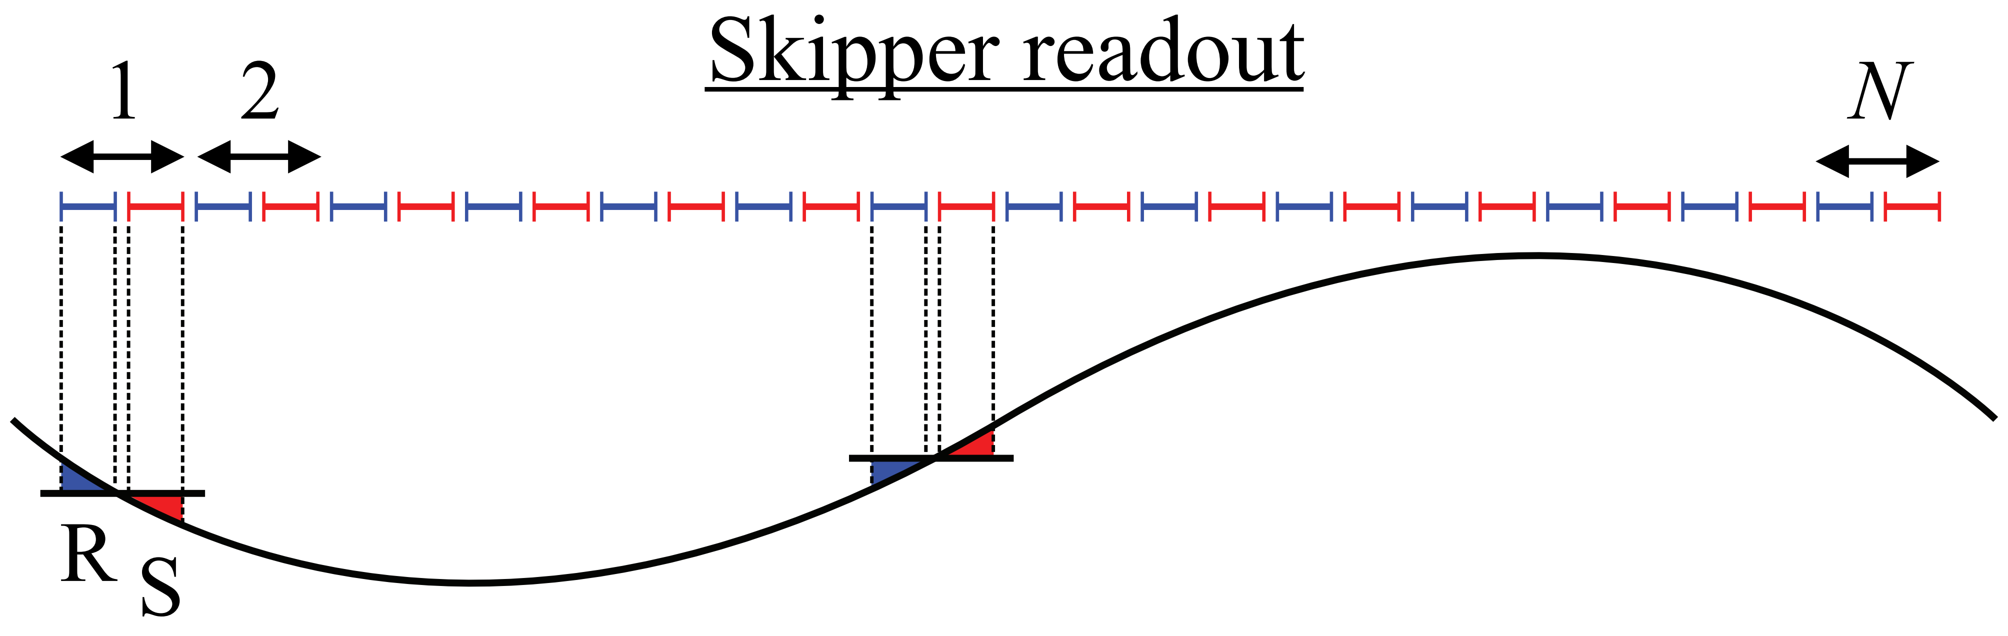
⟷ move charge back and forth

Measure Δ*V* *N* times:



Effect on low frequency noise:

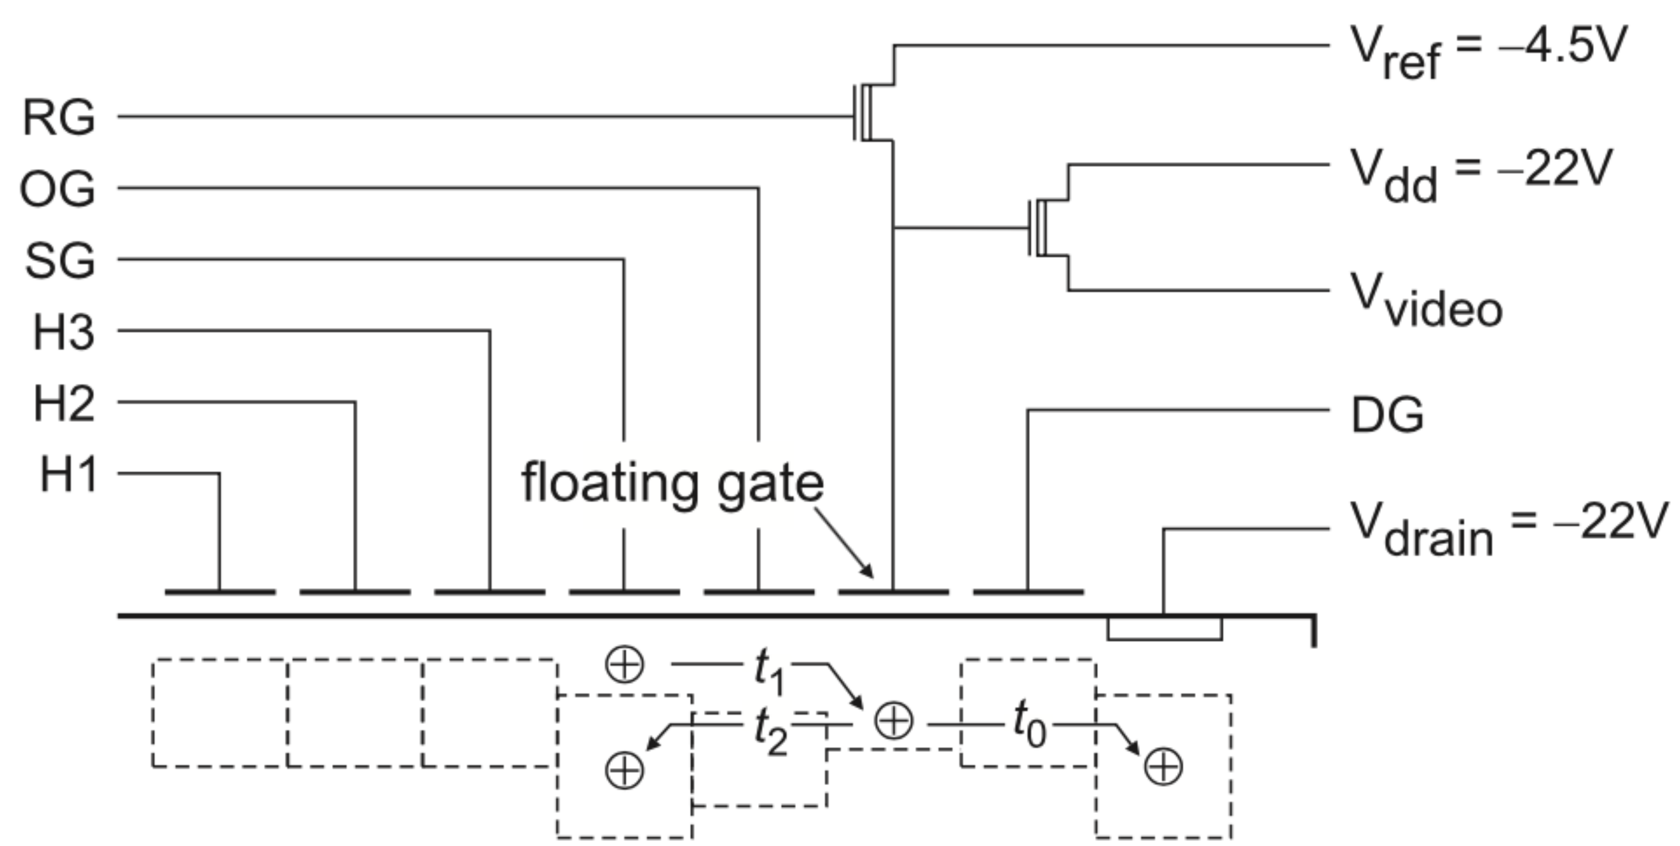




Design by S. Holland at Berkeley Lab

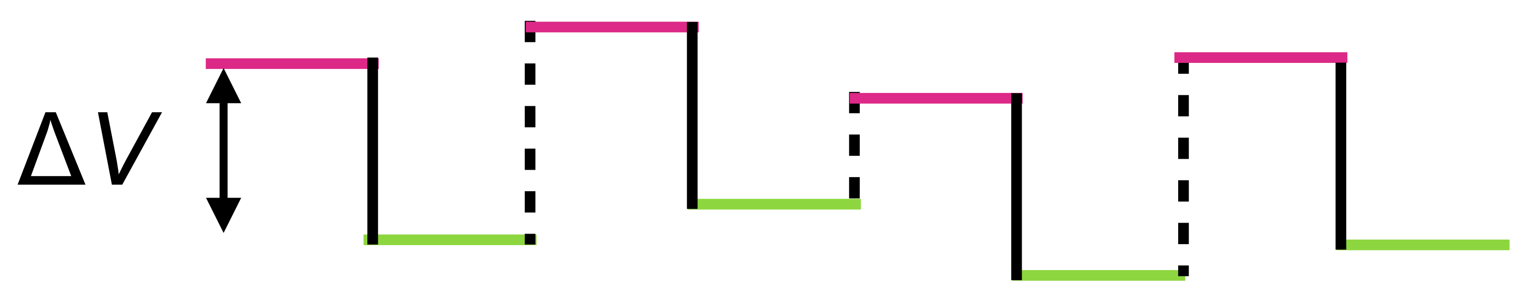
Skipper CCD

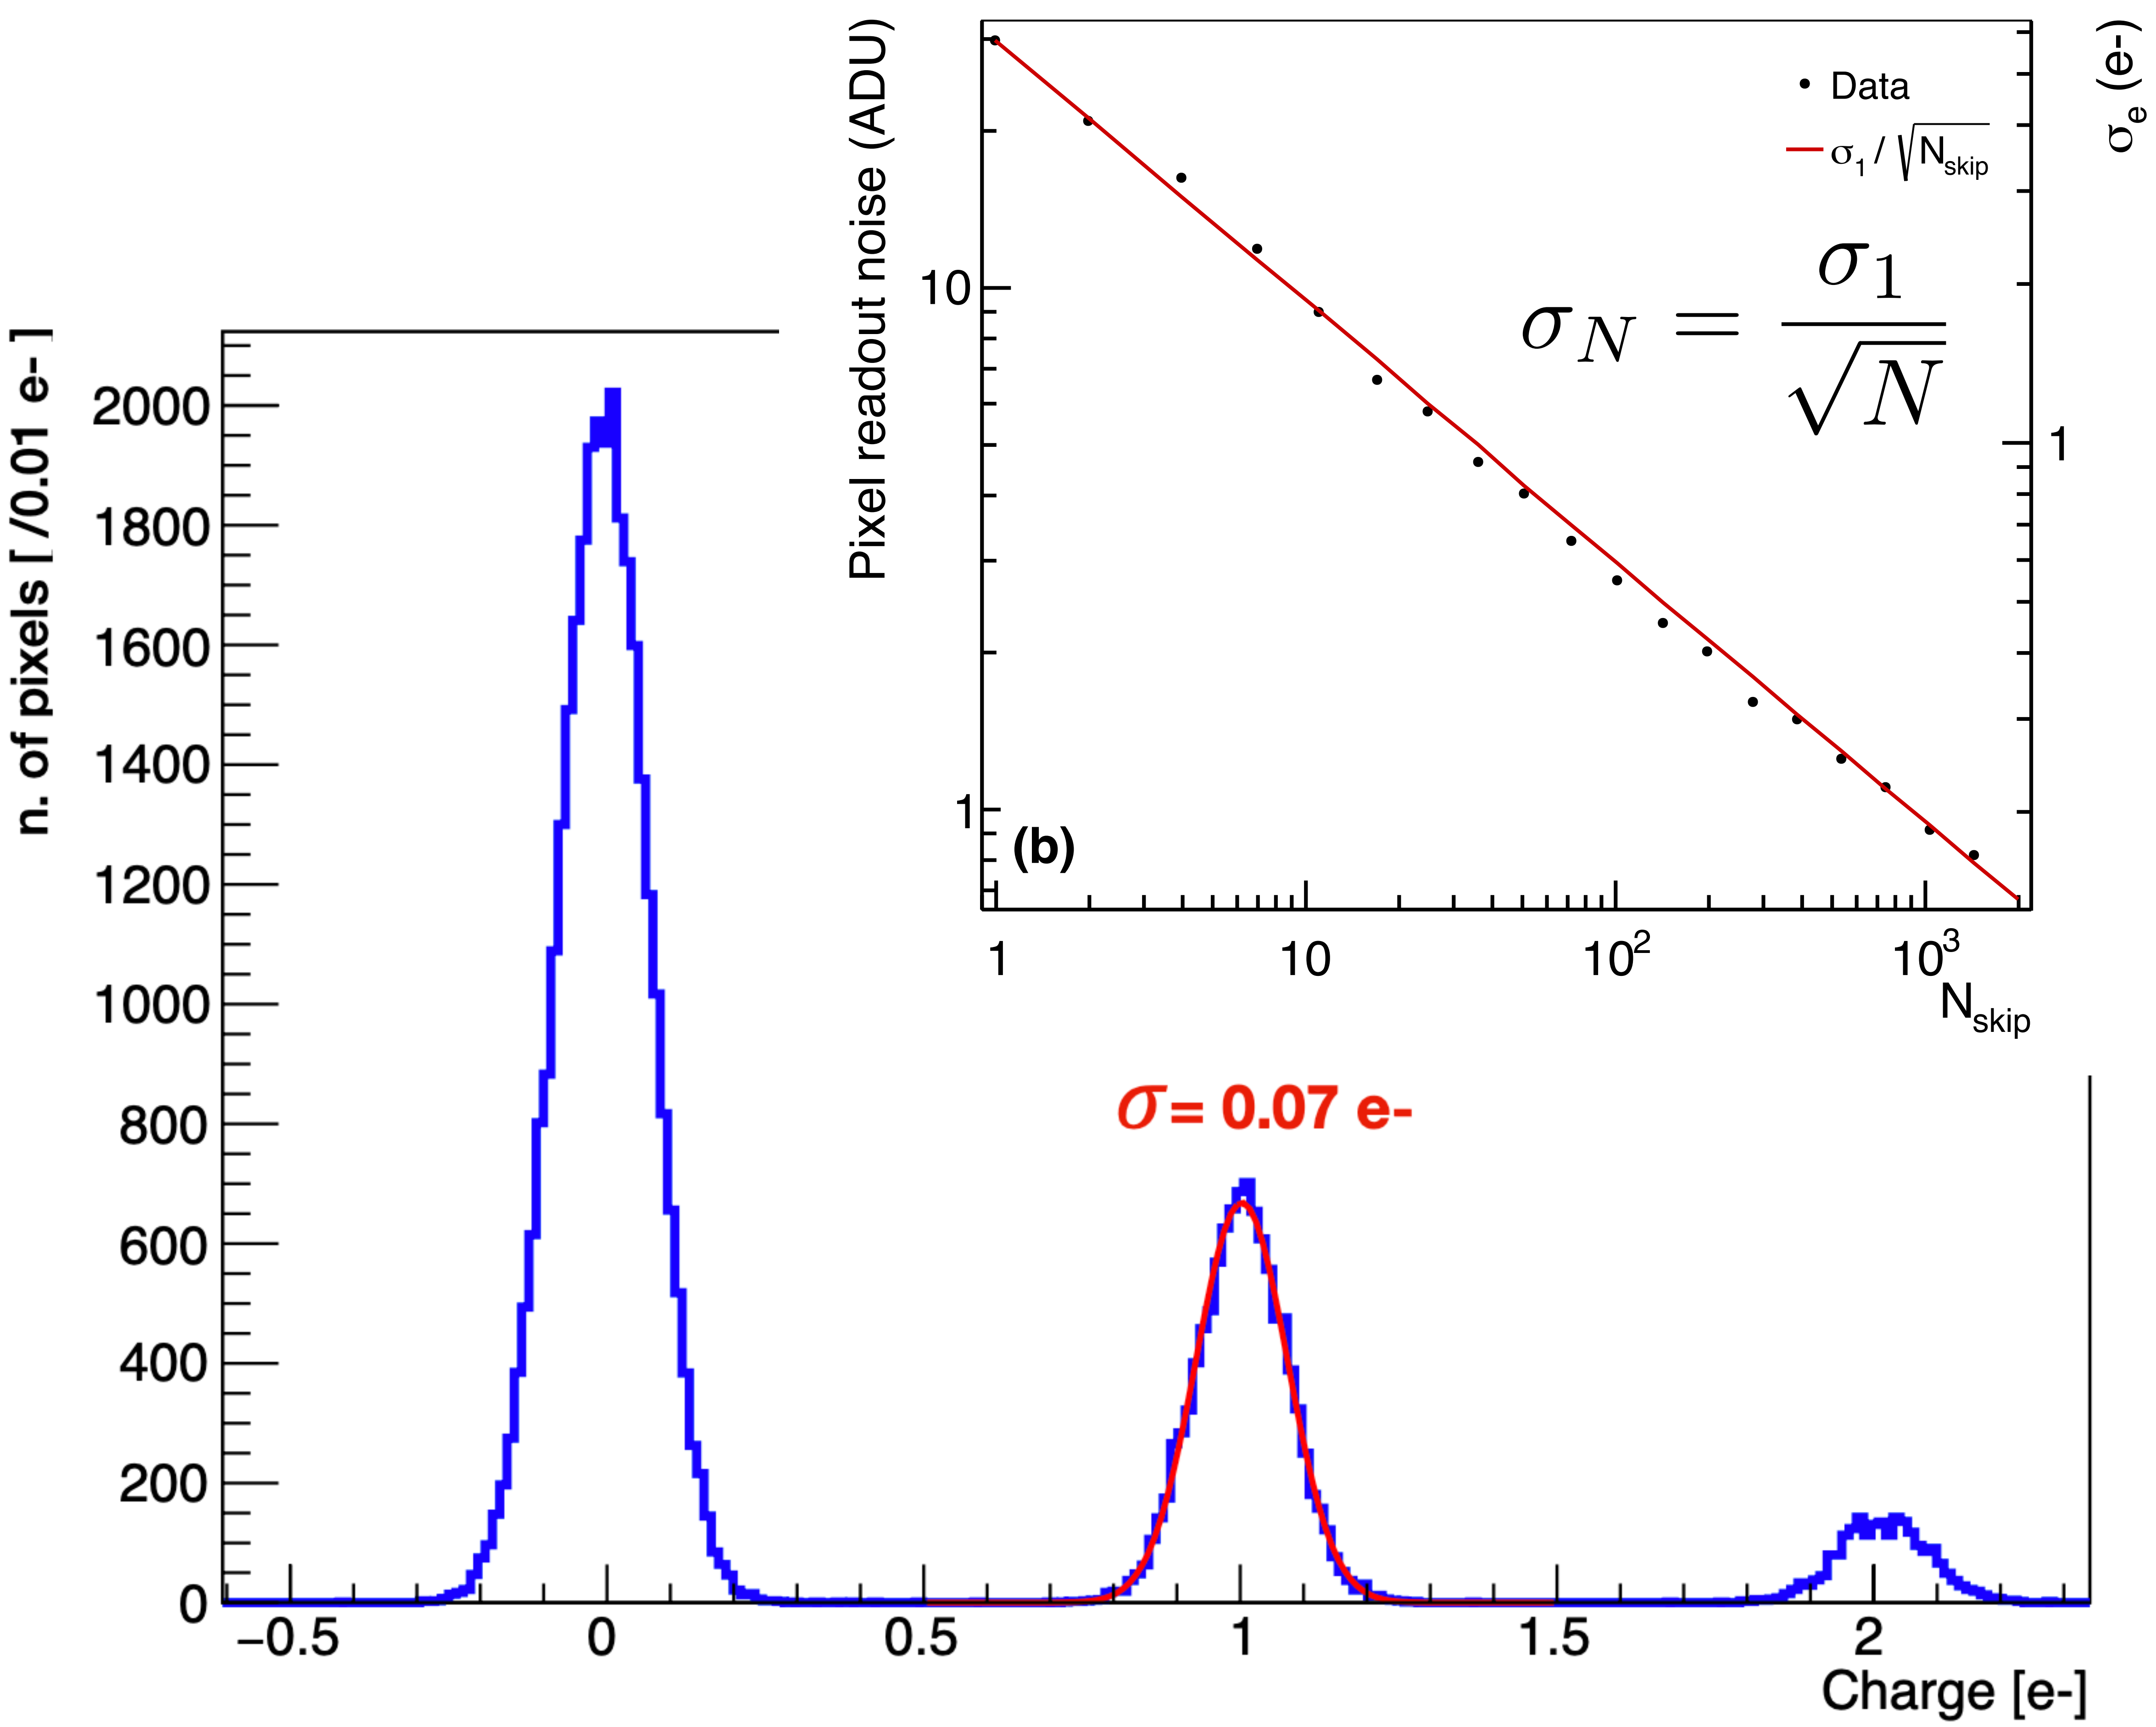
"Skipper" readout: Perform N uncorrelated measurements of the same pixel.



move charge back and forth

Measure ΔV N times:

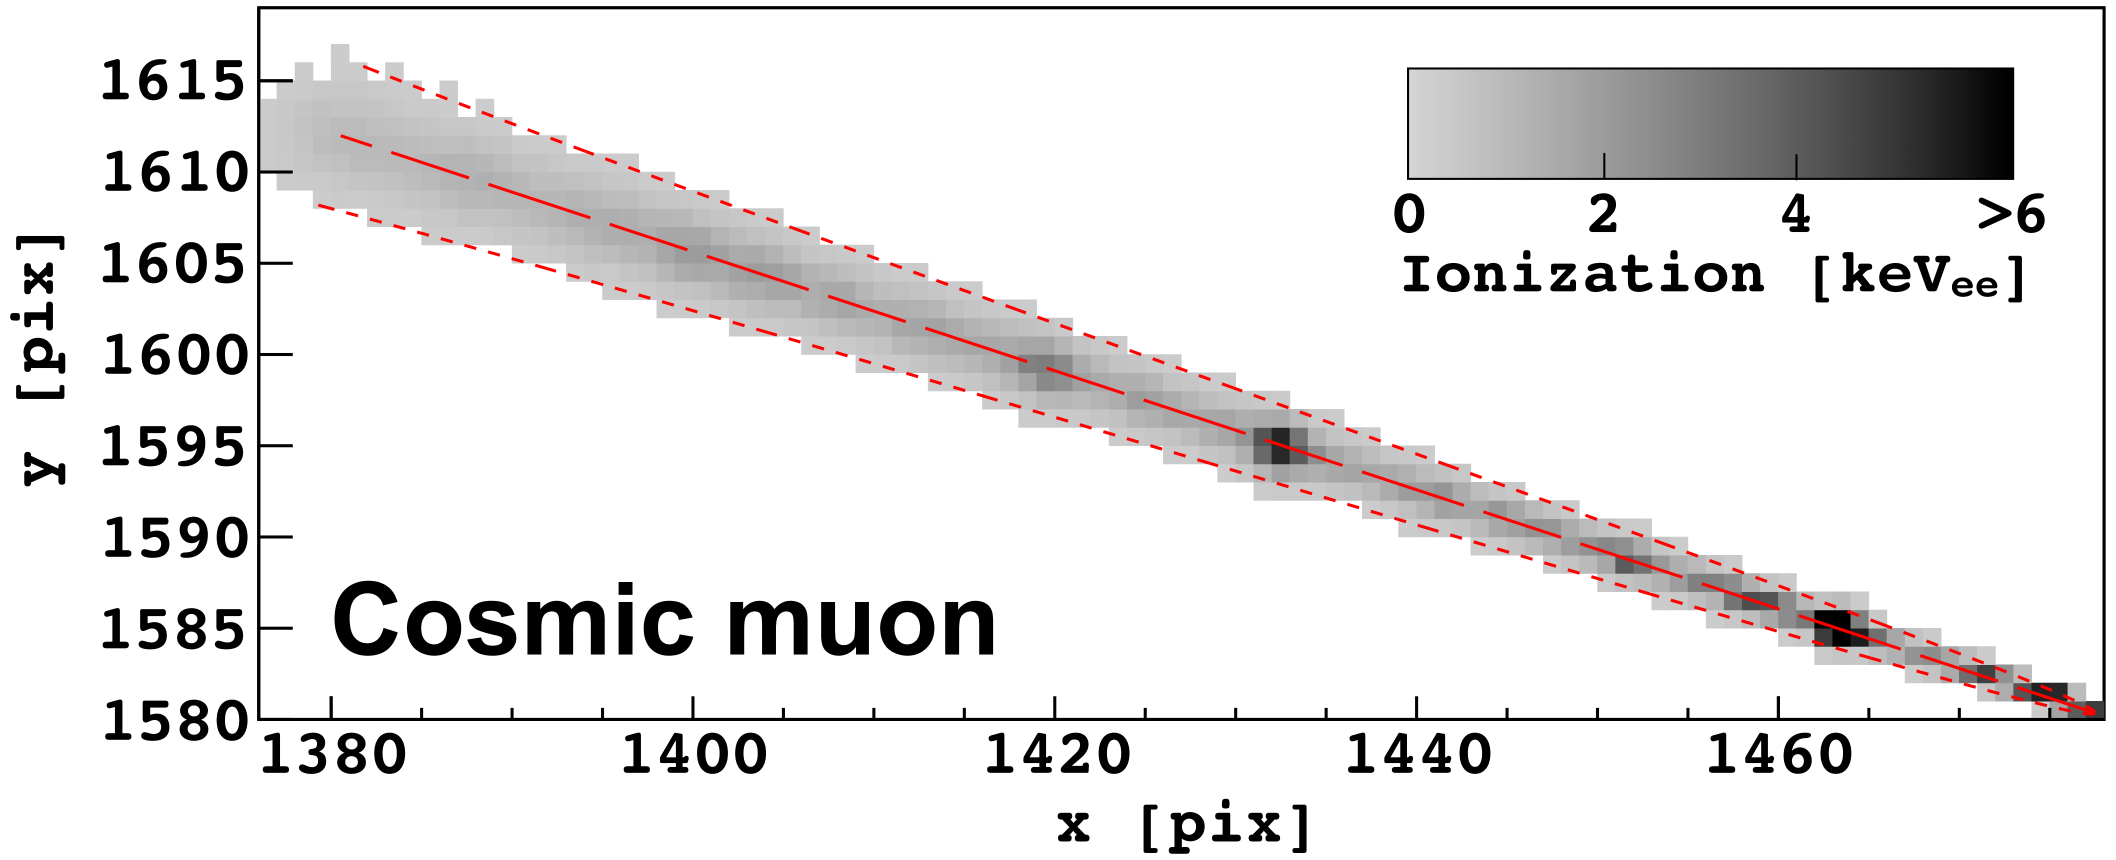


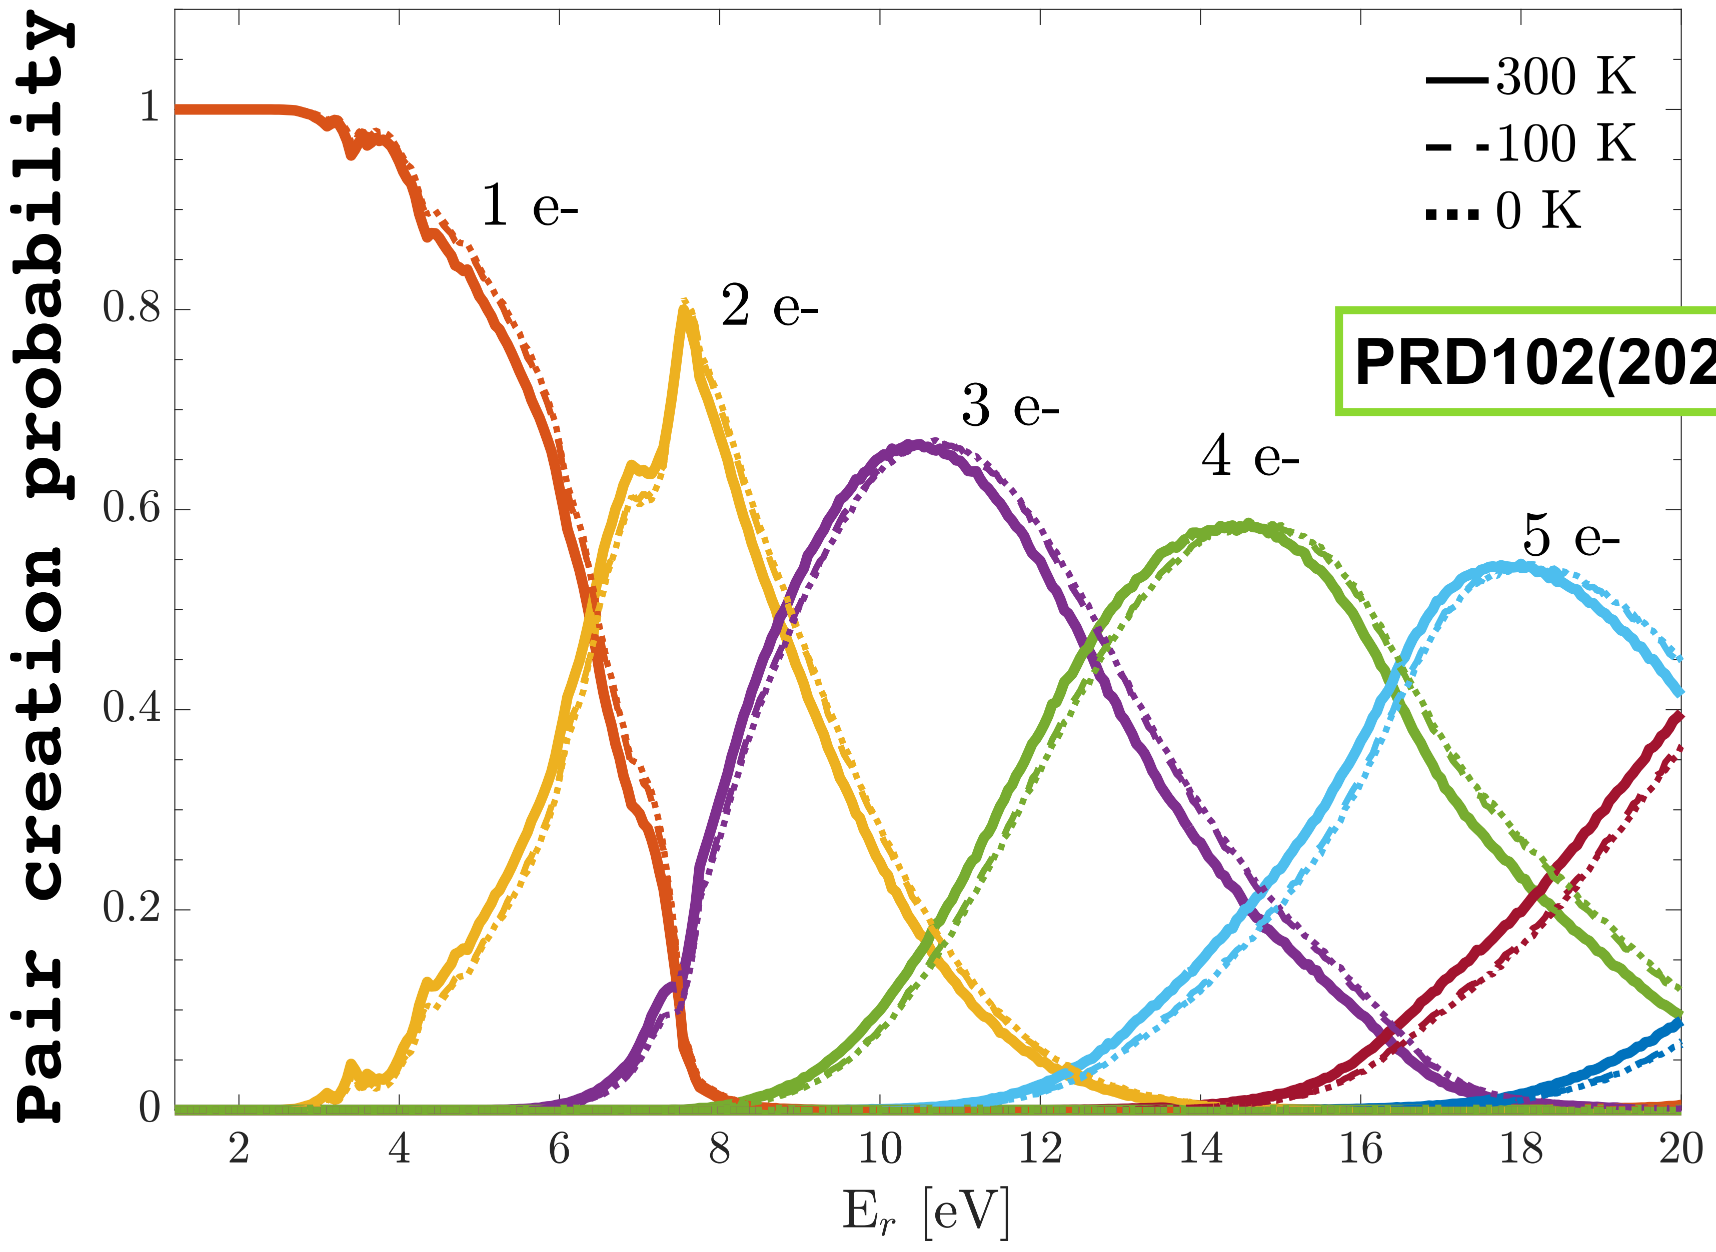


$$\sigma_N = \frac{\sigma_1}{\sqrt{N}}$$

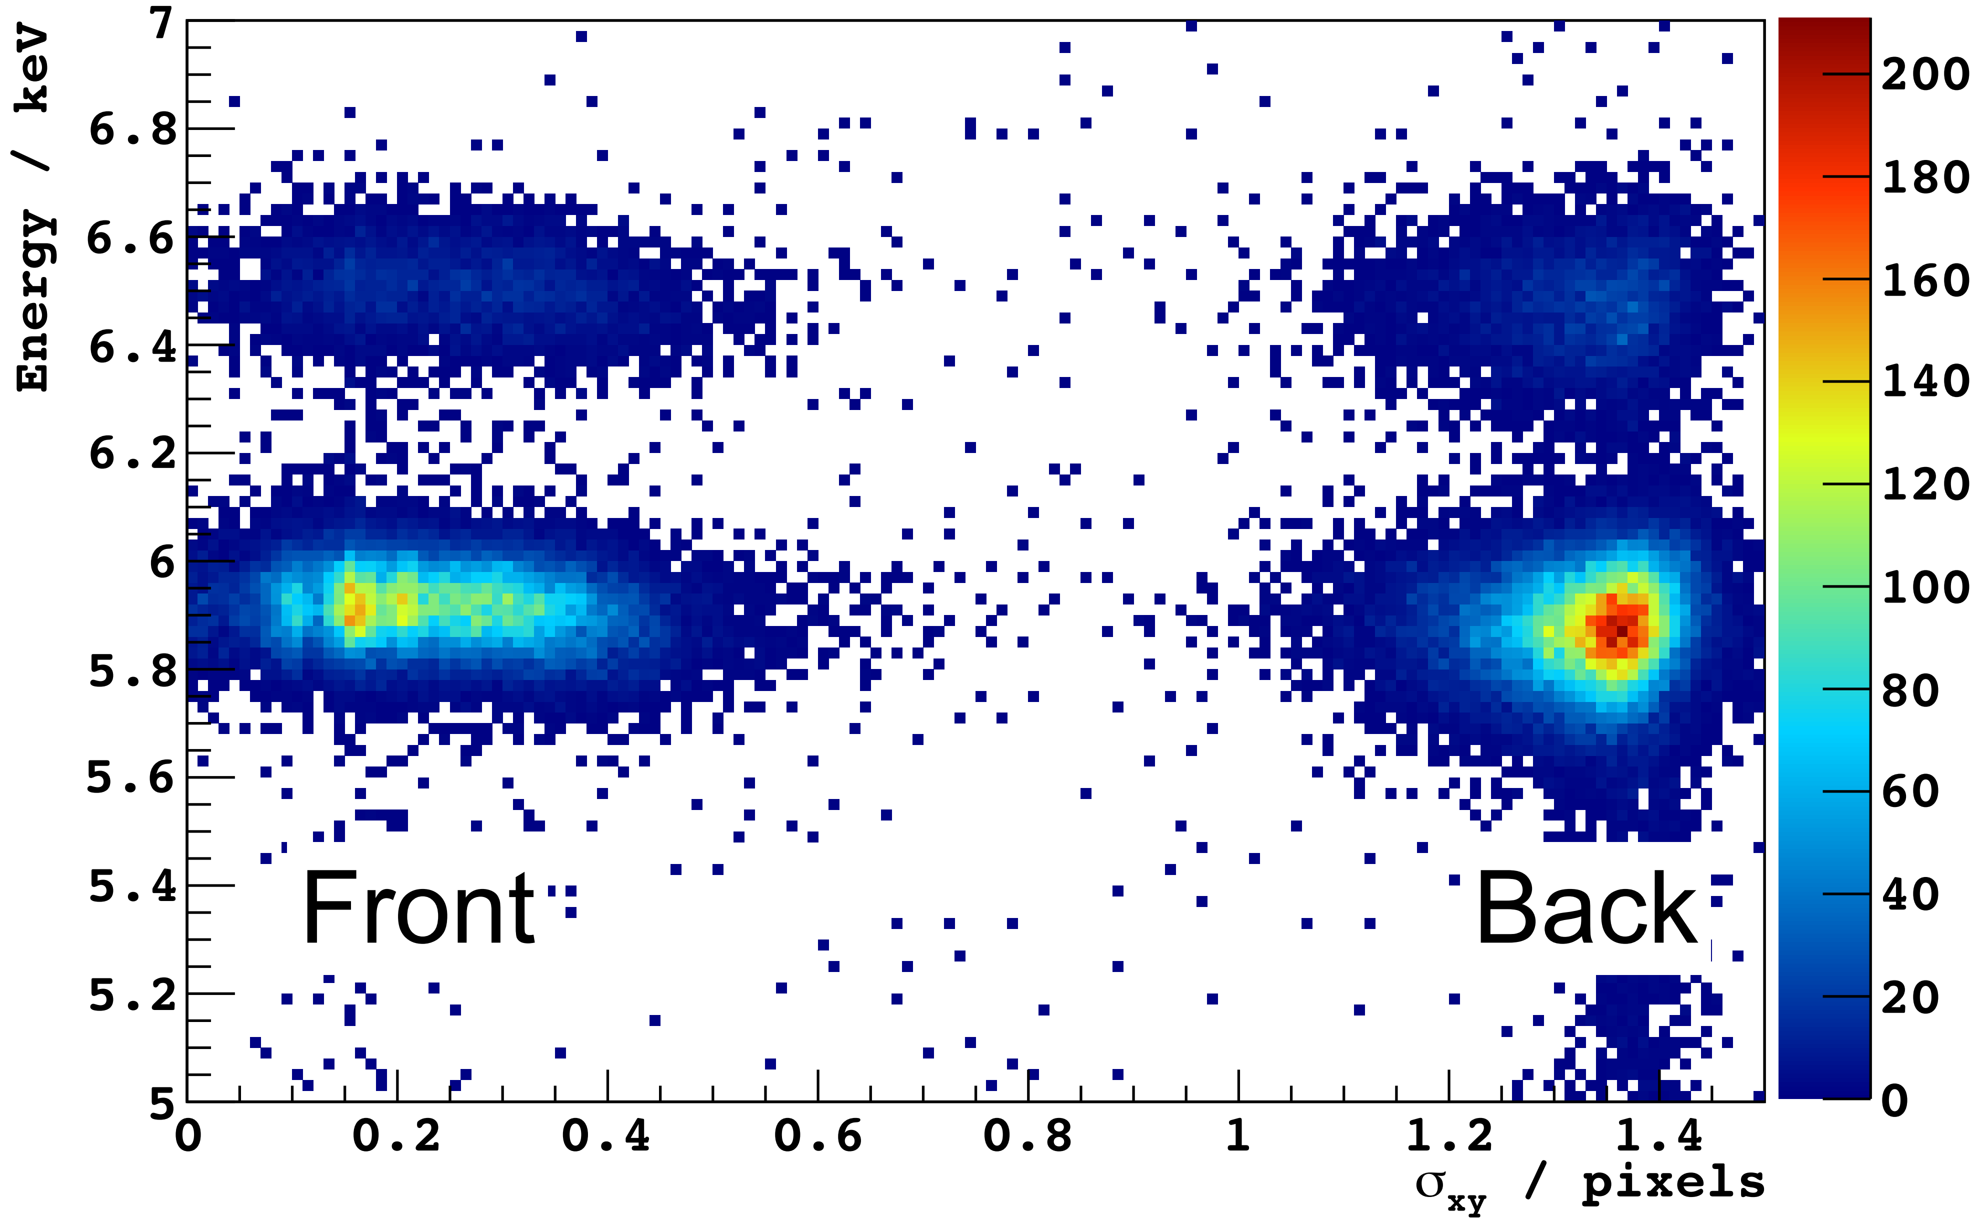
Characterization

- Extensive research program to characterize the response of CCDs: energy / *z* recon.
- Sources: optical photons, X rays, γ rays, neutron sources, etc.
- Detailed models, e.g., charge generation, diffusion and collection.



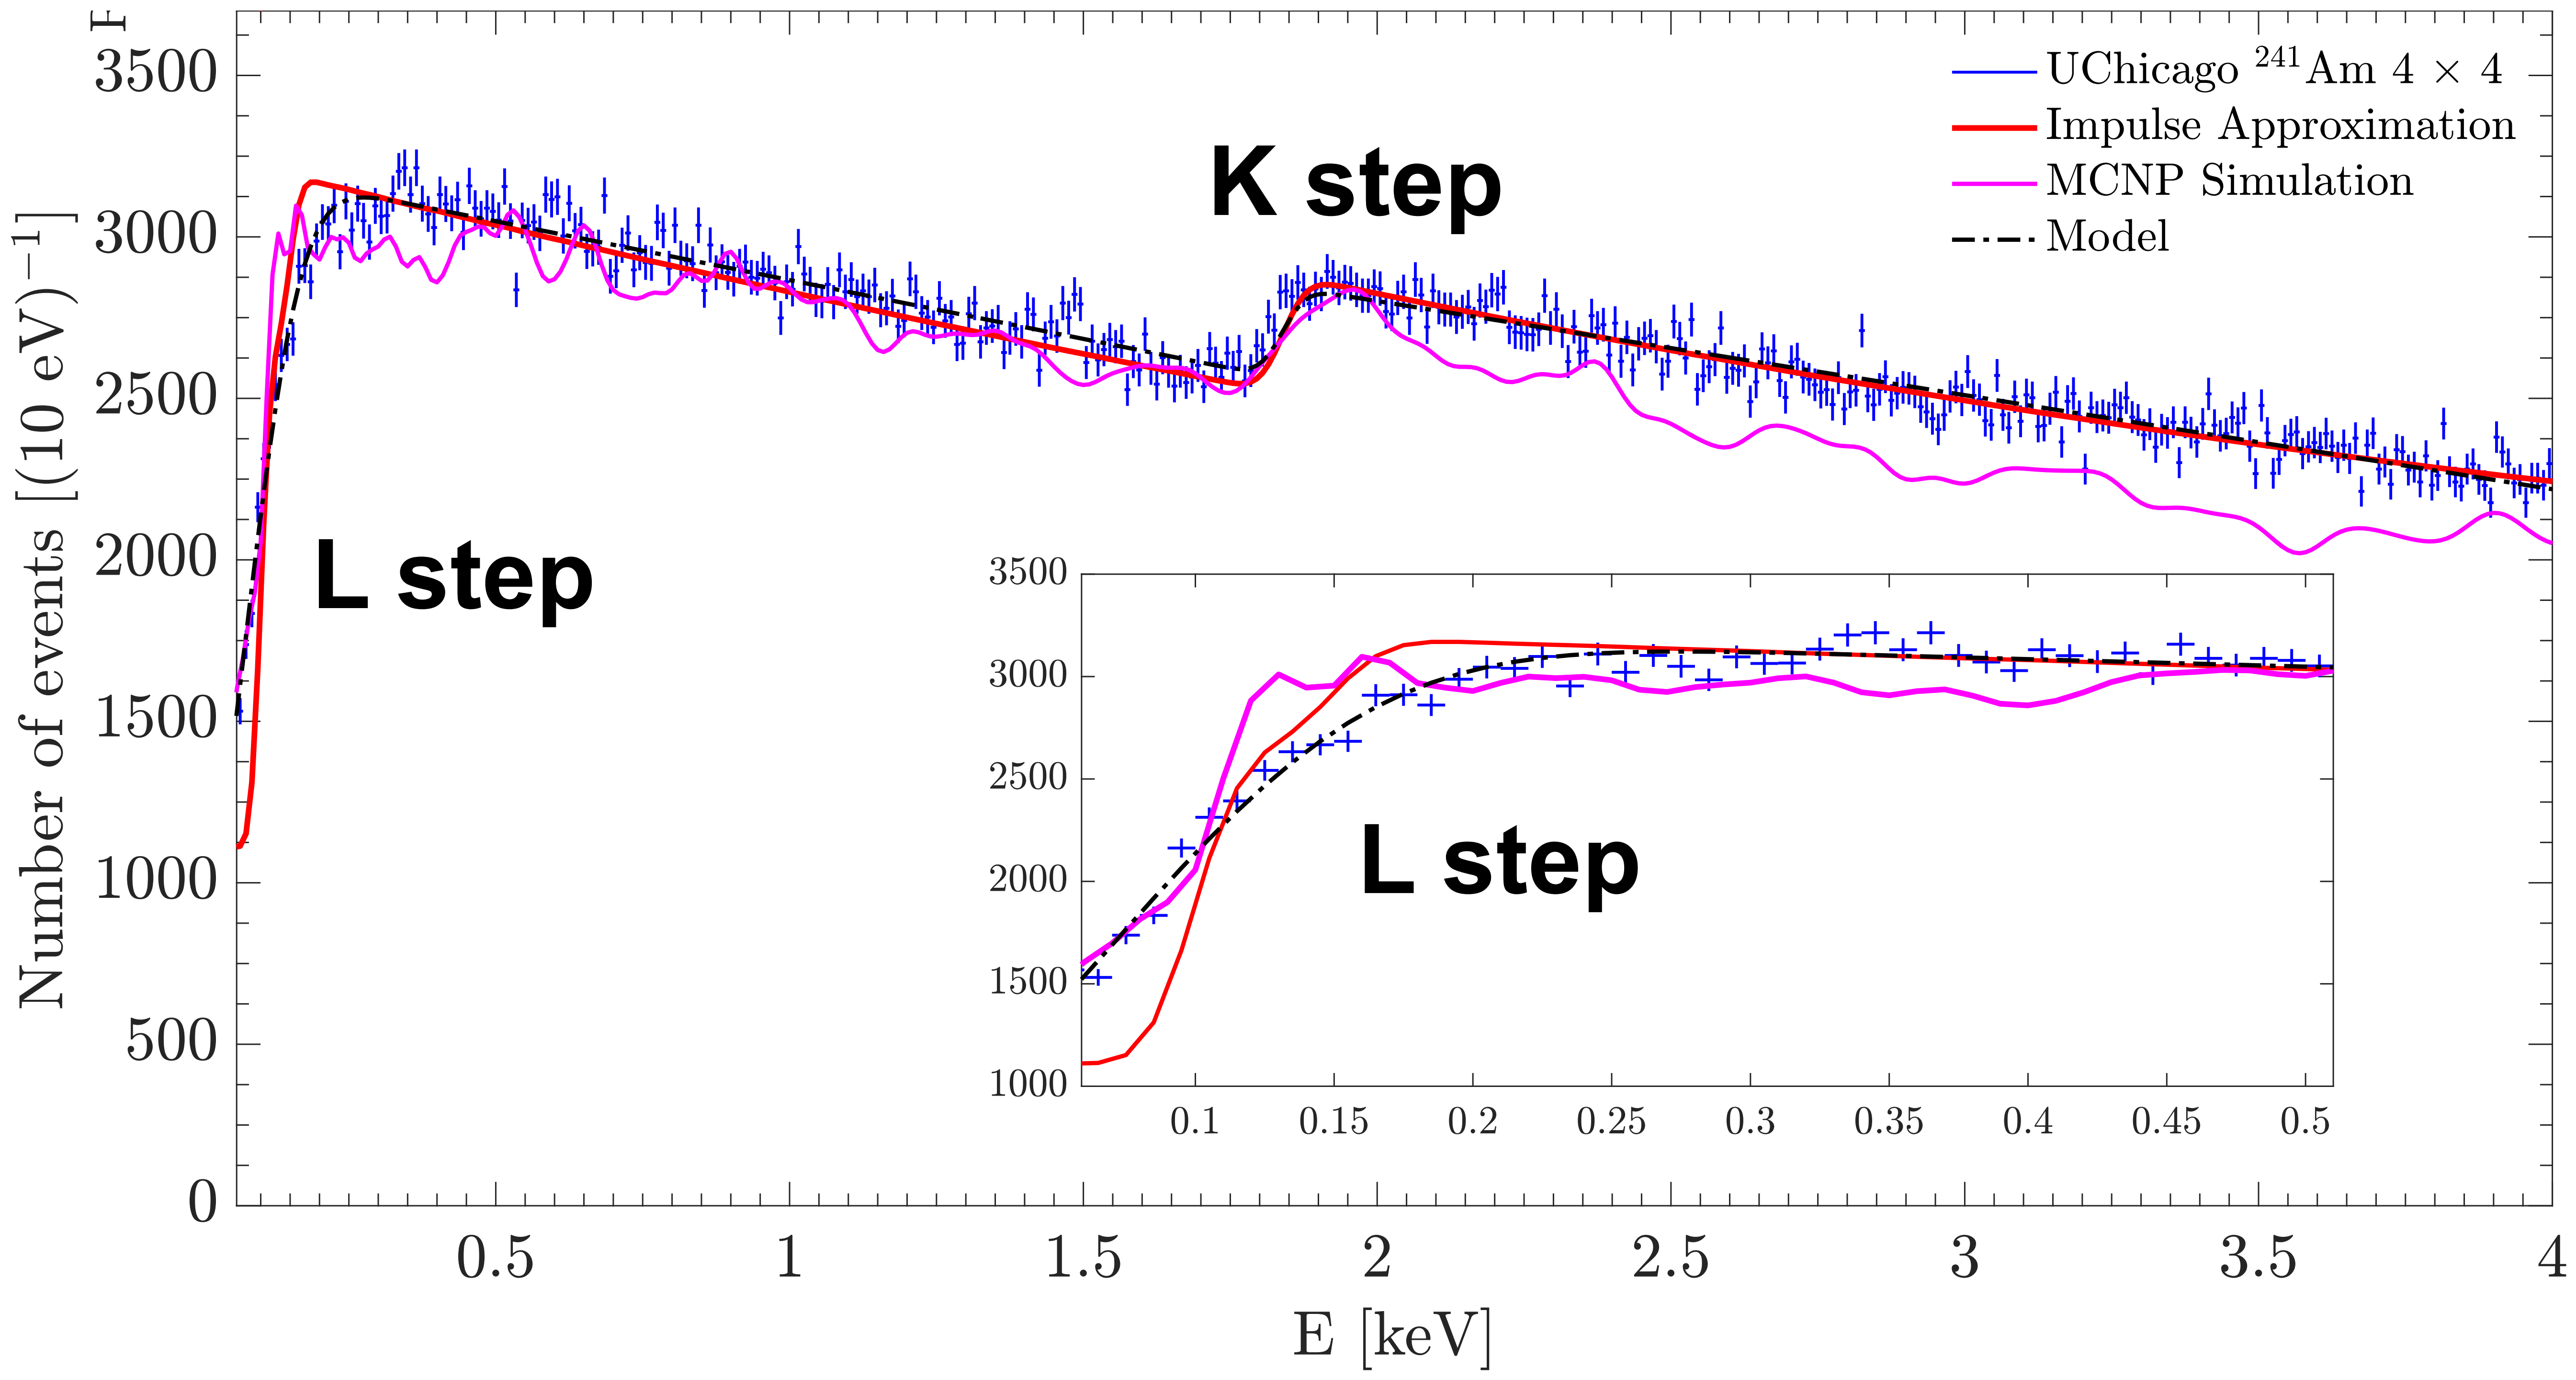


PRD102(2020)063026



Example

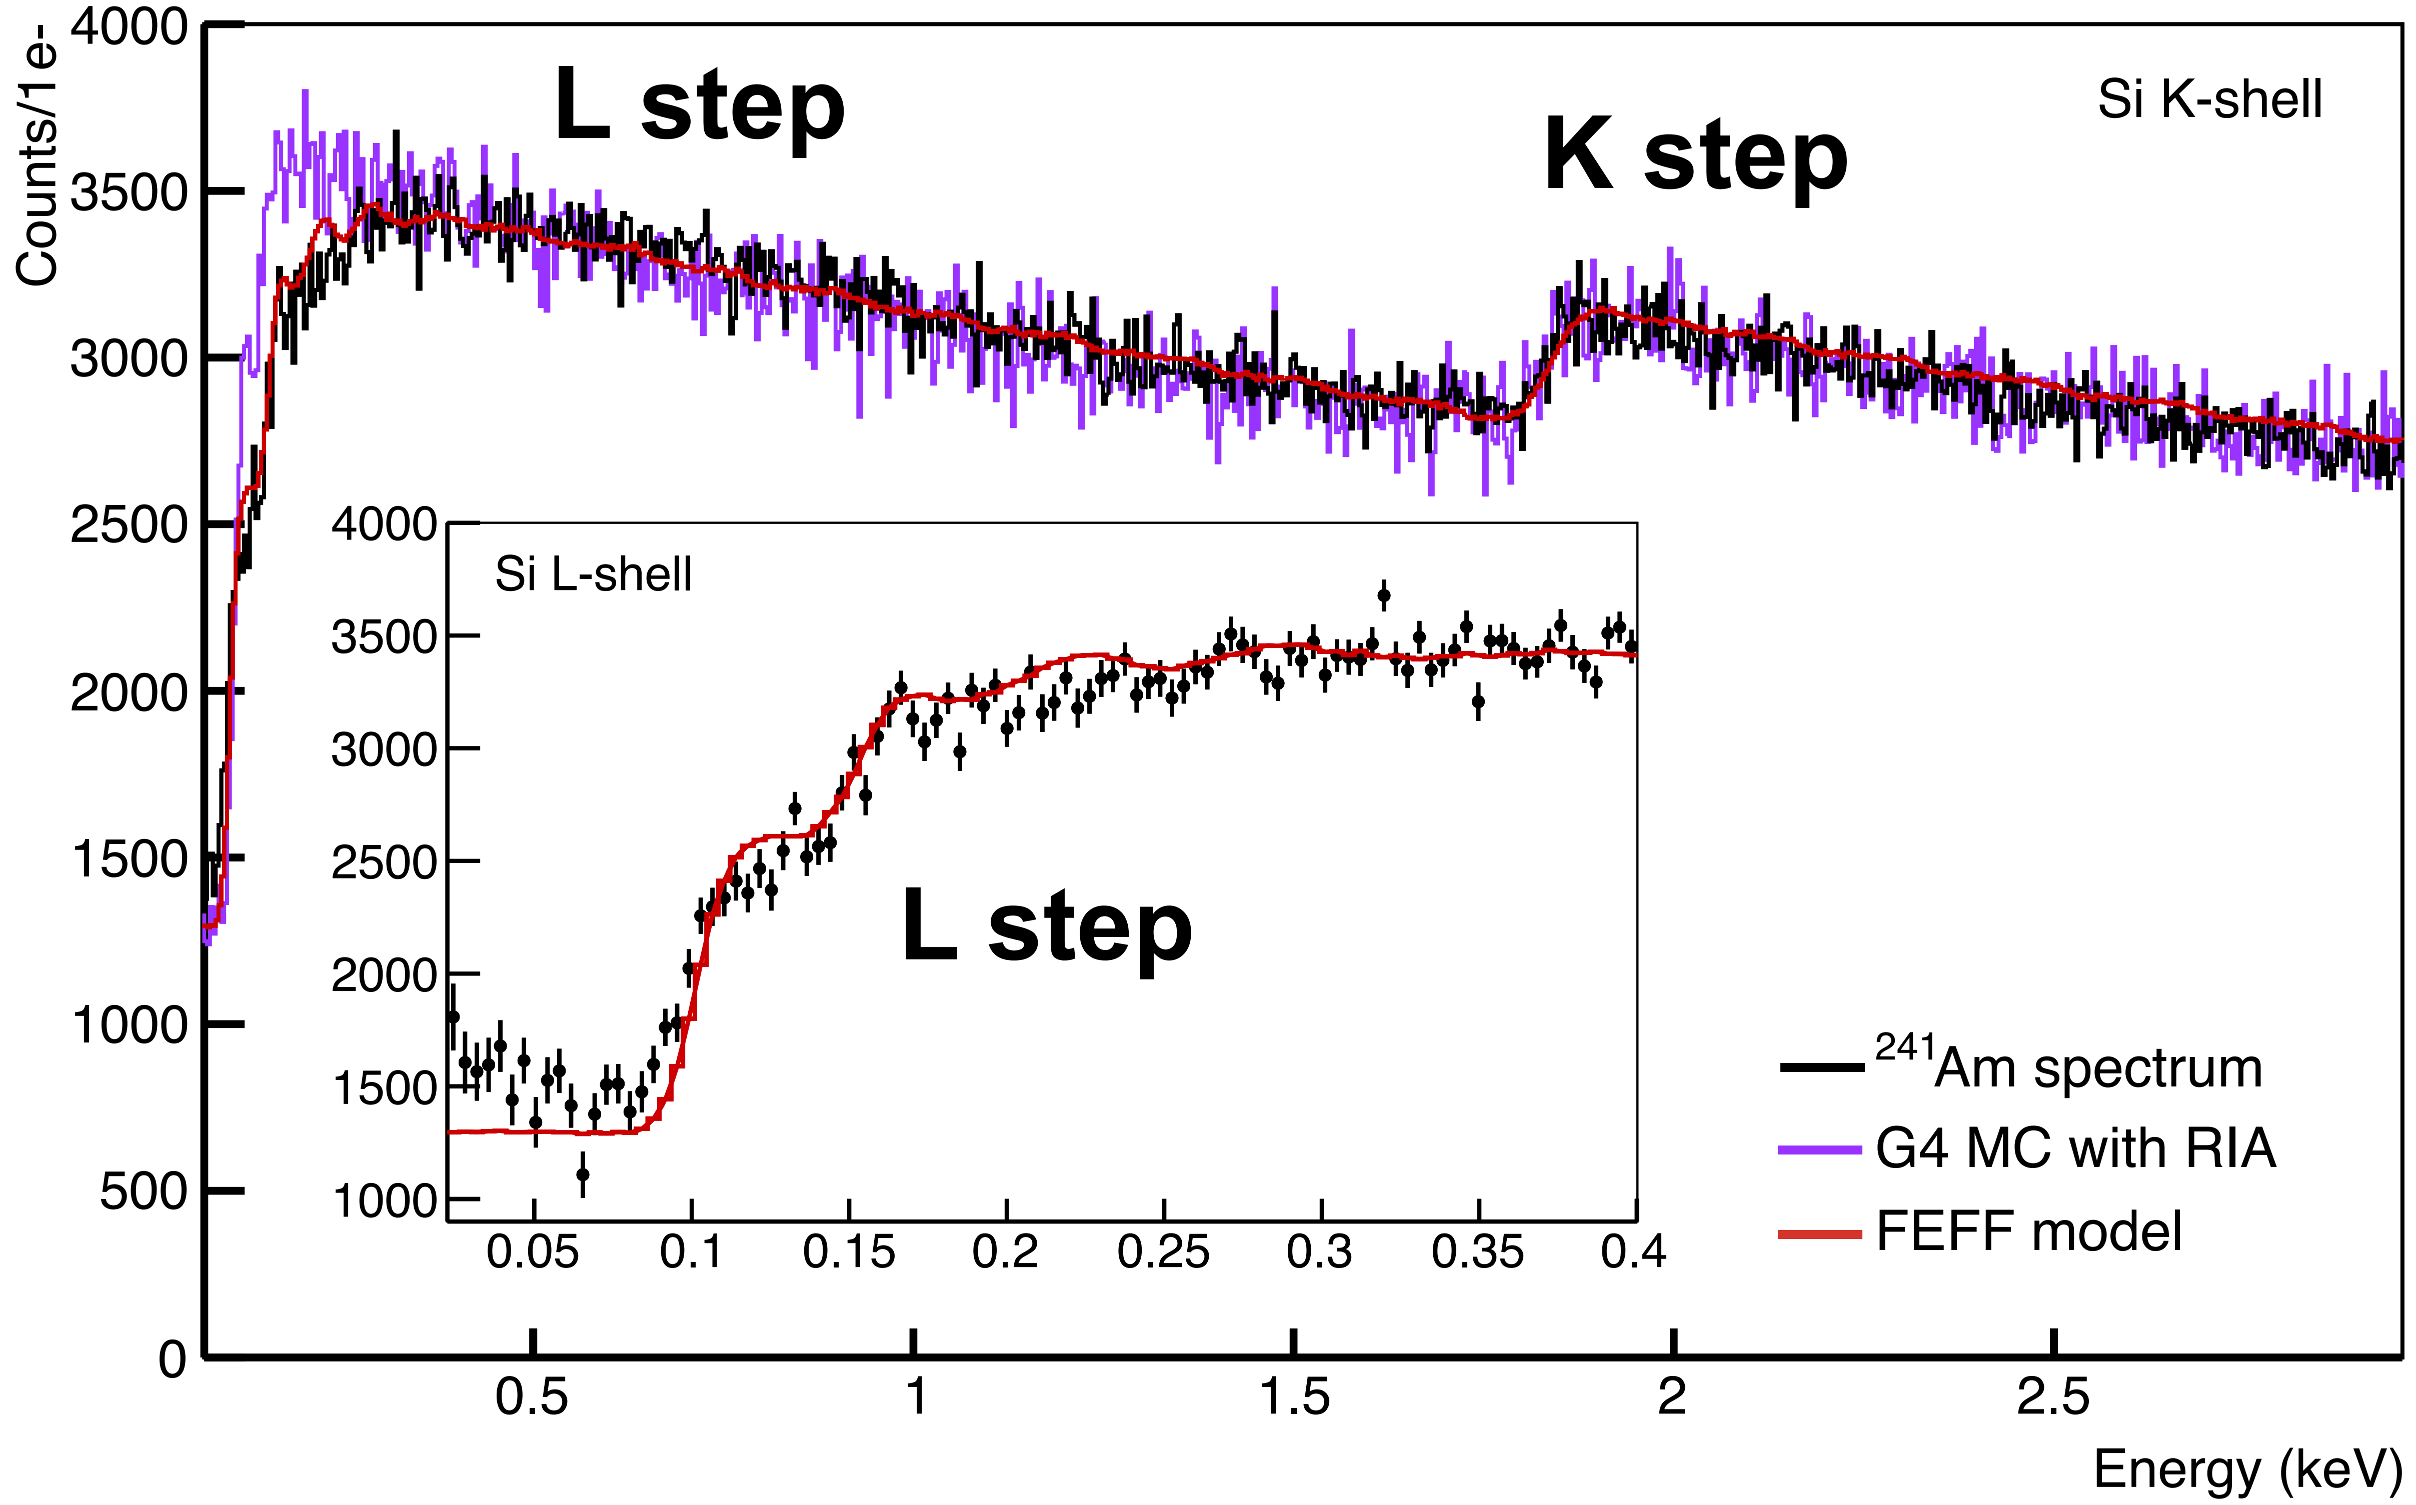
- First measurement of the electronic-recoil spectrum from Compton scattering at low energies: PRD96(2017)042002
- Used original DAMIC CCDs with conventional readout. Threshold: 60 eV_{ee}.
- Observed steps at the binding energies of the atomic shells in silicon.
- Apparent softening of the L step at 100-150 eV.
- Incorrect detector response model or physics?



Example

R. Smida's talk

- Precision measurement with a skipper CCD improved energy resolution and decreasing threshold to 23 eV_{ee}: arXiv:2207.00809(2022)
- Confirmed softening of the L step, observed structure in the L step.
- Detector response model is good!
- Softening reproduced with *FEFF* code, which performs full QM treatment.
- Full QM calculations may be needed to correctly describe electronic recoil spectra.

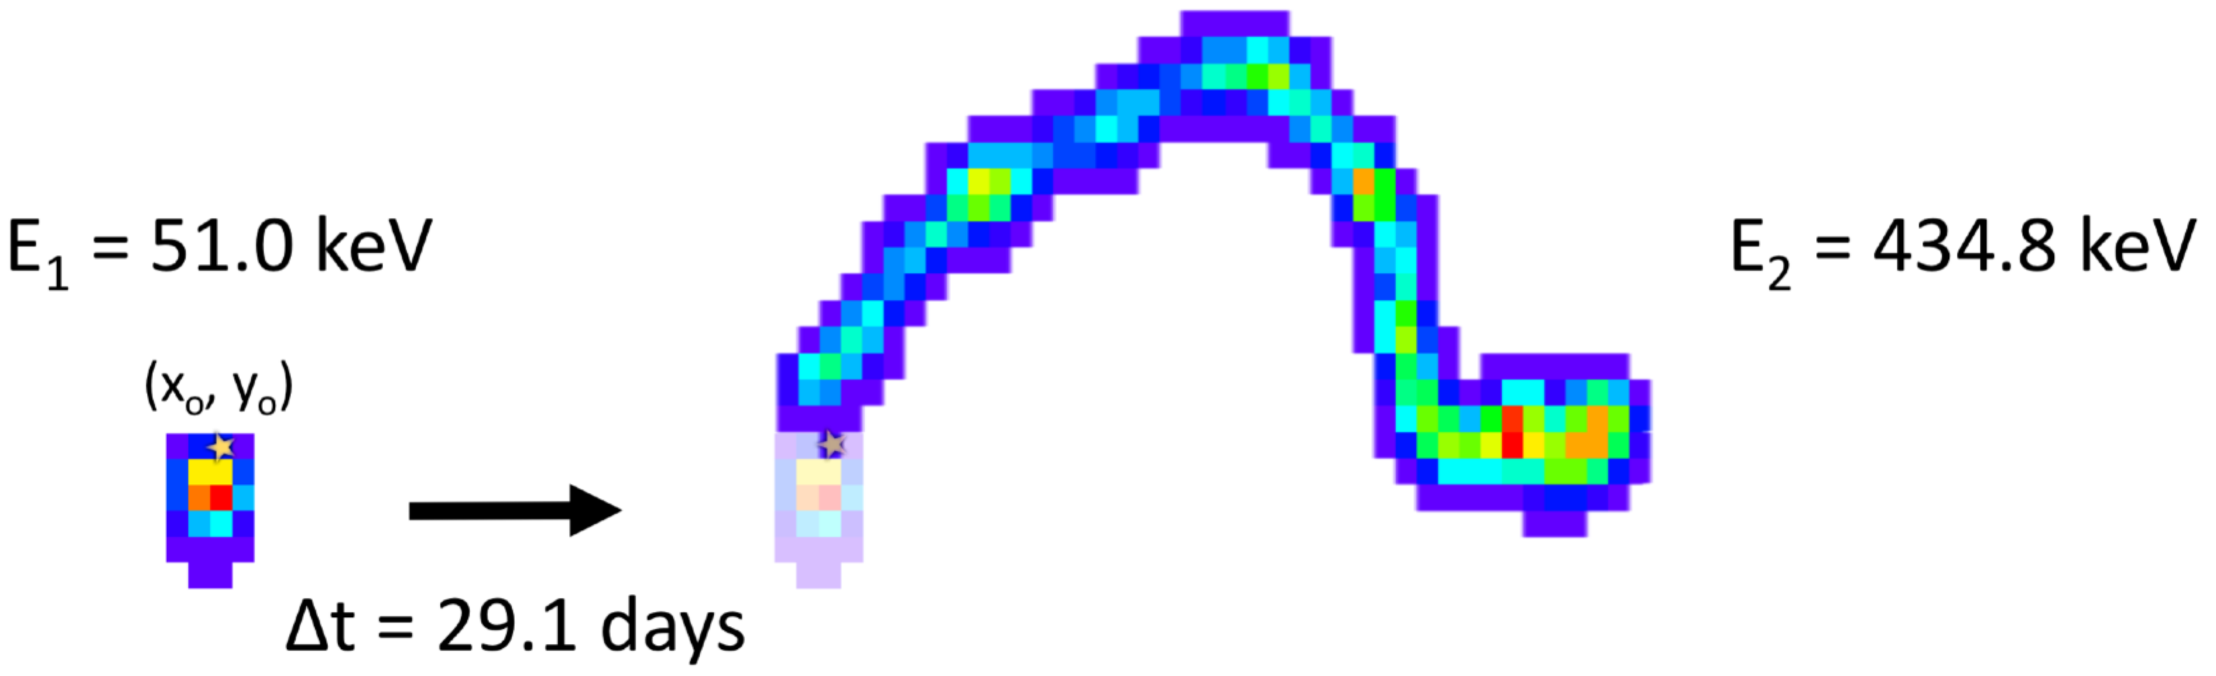


Radioactive backgrounds

- Particle classification (α, β, NR) by track topology (at high E>100 keV_{ee}).
- Spatial coincidence searches to identify decay sequences: JINST16(2021)P06019
  - **Cosmogenic ^{32}Si:** ^{32}Si ($T_{1/2}$= 150 y, β) ➔ ^{32}P ($T_{1/2}$= 14 days, β)

    140 ± 30 μBq / kg

  - Also upper limits on every β emitter in the U/Th chain.



- Measurement of the cosmogenic activation of ^{3}H in silicon by exposing a CCD to a neutron beam: PRD102(2020)102006

  112 ± 24 atoms / kg /day

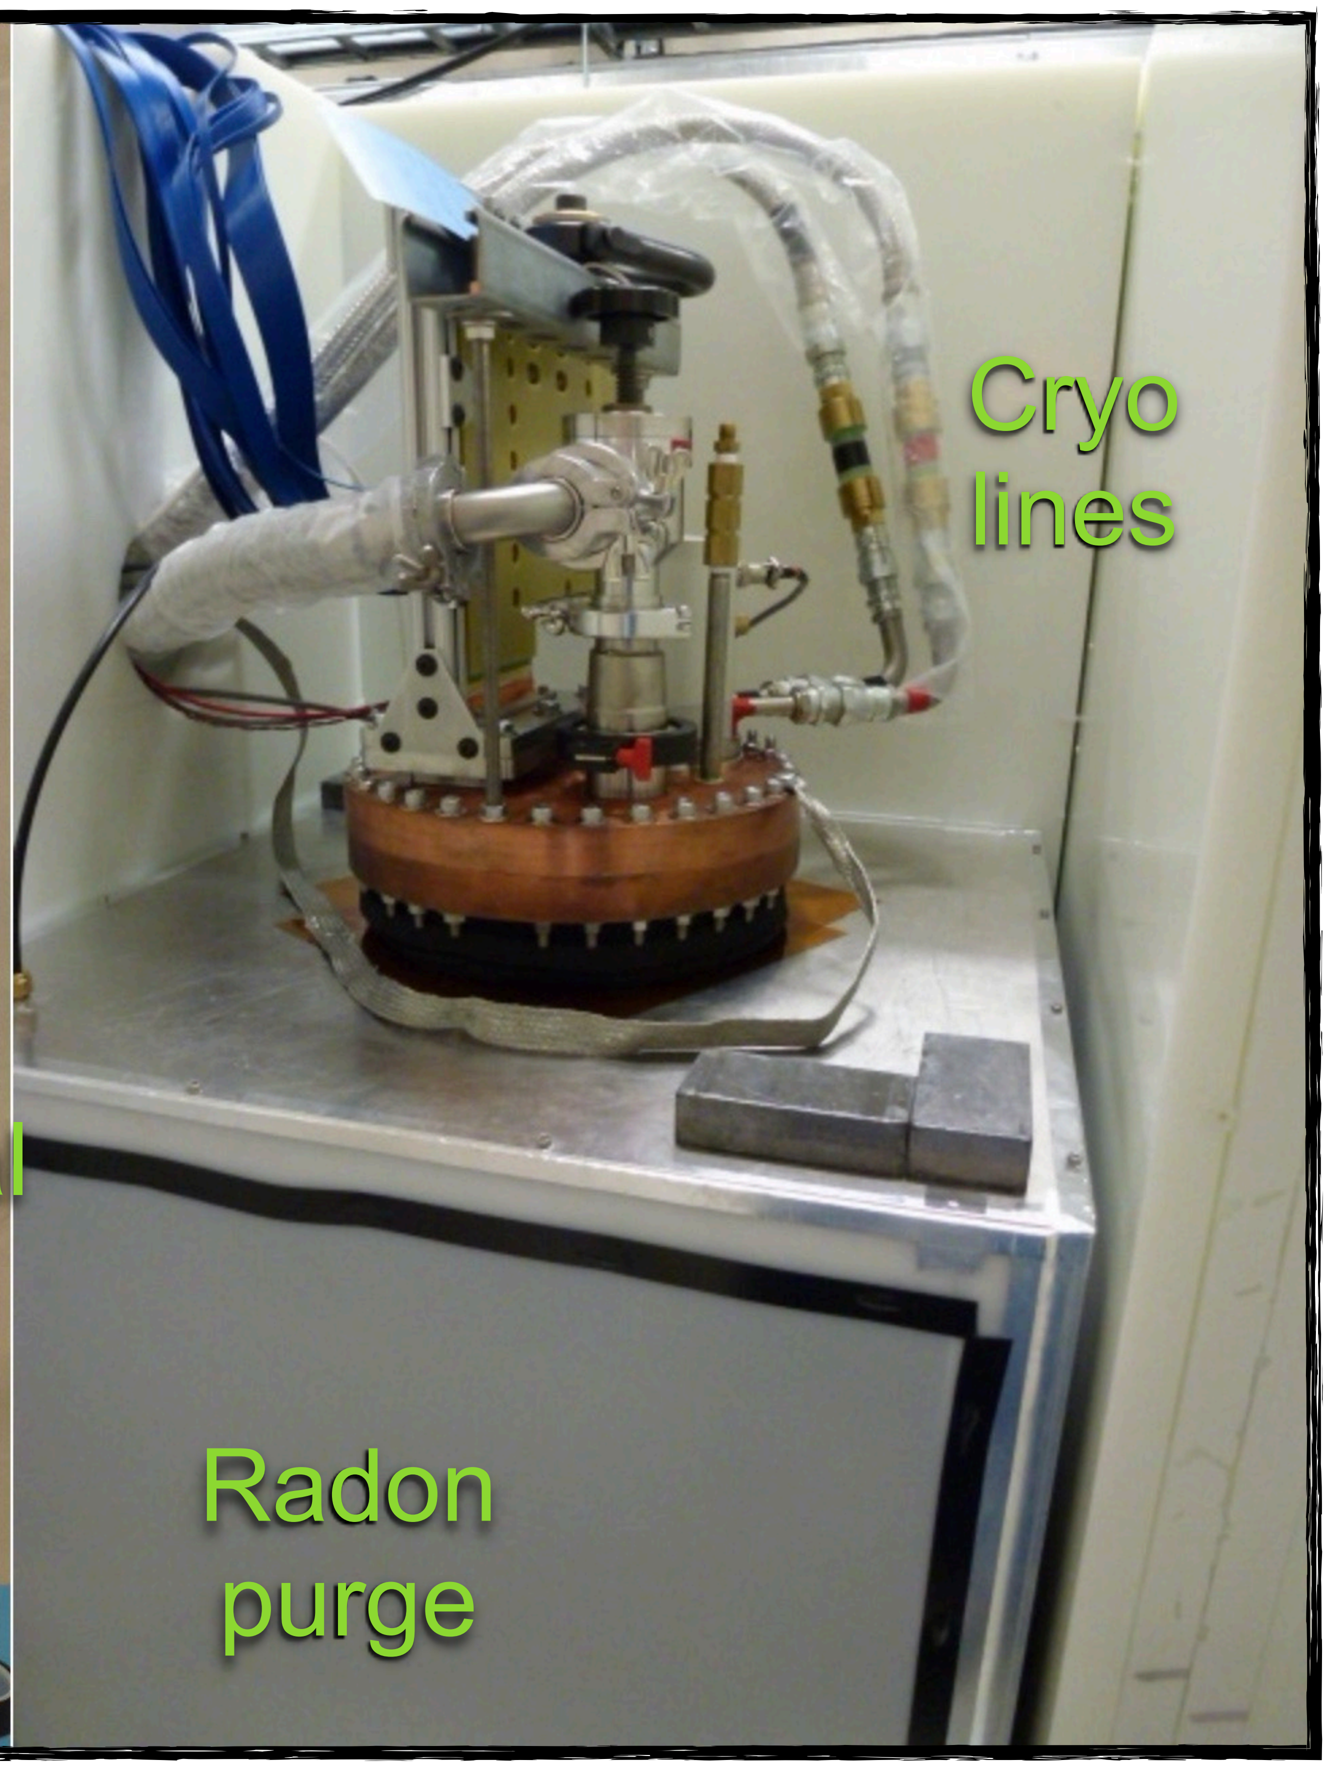
- Exhaustive radio-assay program: PRD105(2022)062003

DAMIC at SNOLAB

CCD Box

Cryostat insert

In shield

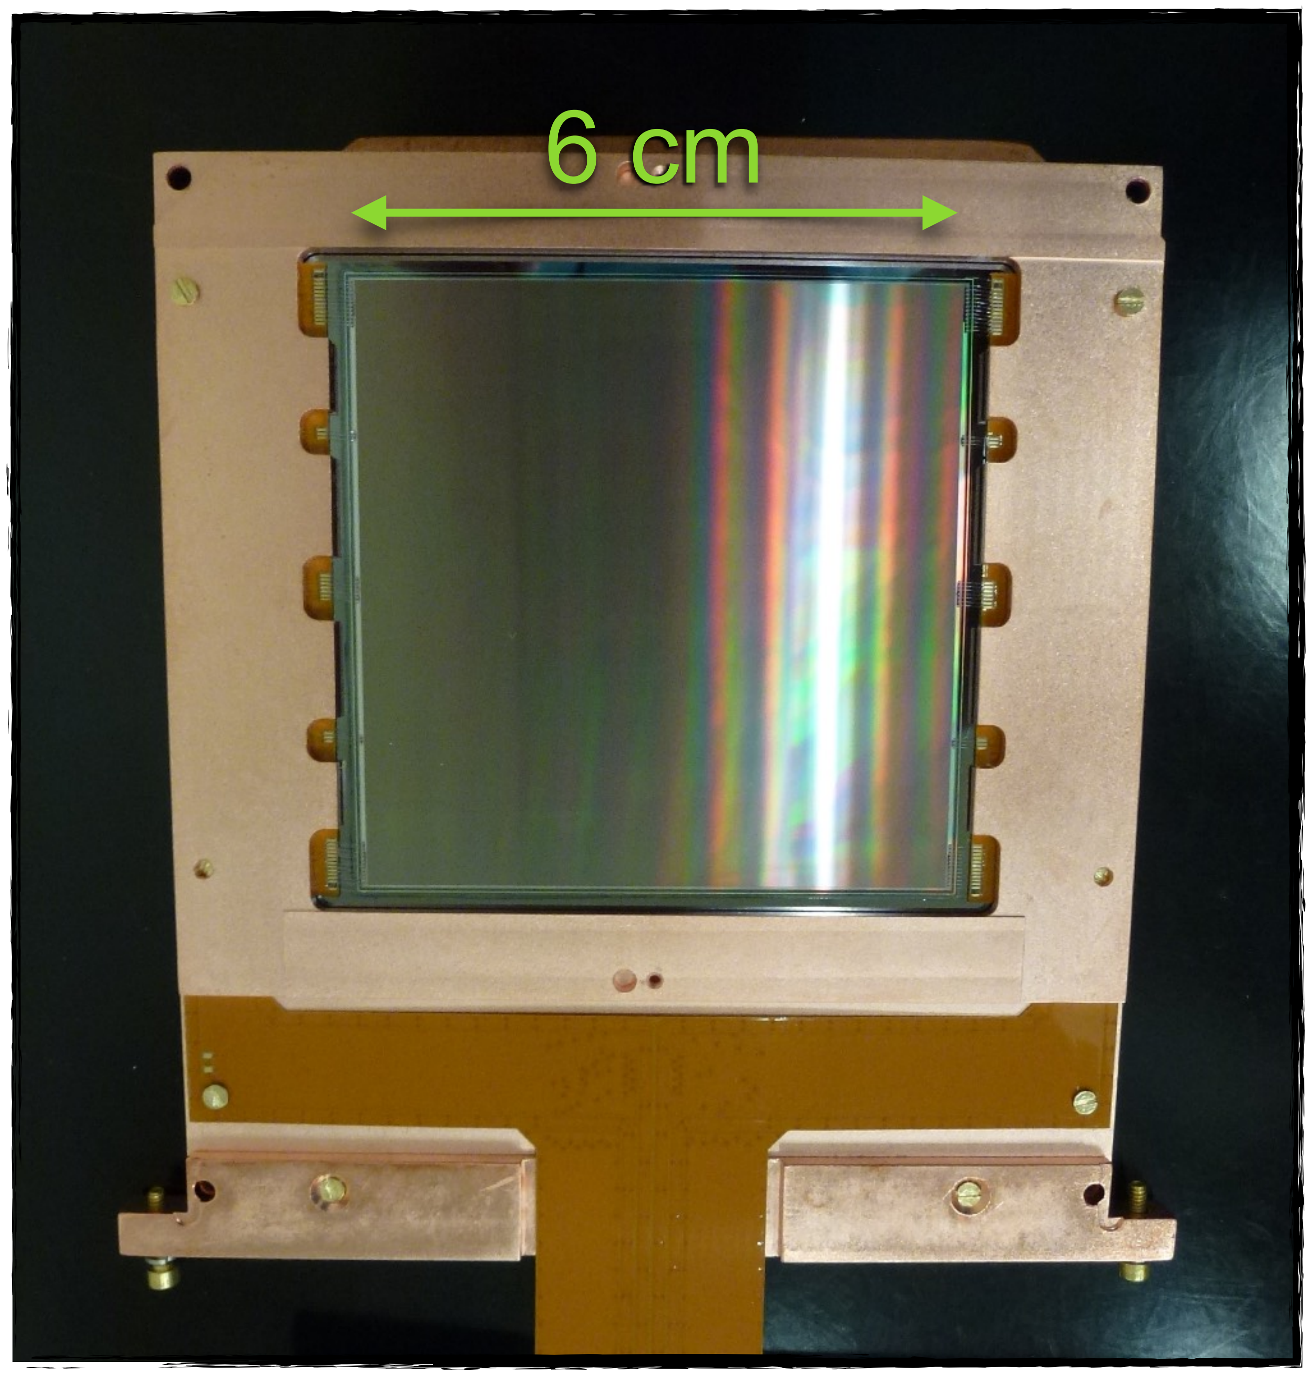


External shield

DAMIC at SNOLAB

- First array of CCDs operated underground for a DM search. Since 2012.
- 7 CCDs (6.0 g, 16 Mpix) cooled to 140 K.
- Total (bulk) background rate: ~10 (5) d.r.u.
- Low pixel noise 1.6 e^- with conventional readout.
- Extremely low leakage current: 2 x 10^{-22} A cm^{-2}.
- DM-e^- scattering results: PRL123(2019)181802
- "WIMP search" with 11 kg-y exposure:

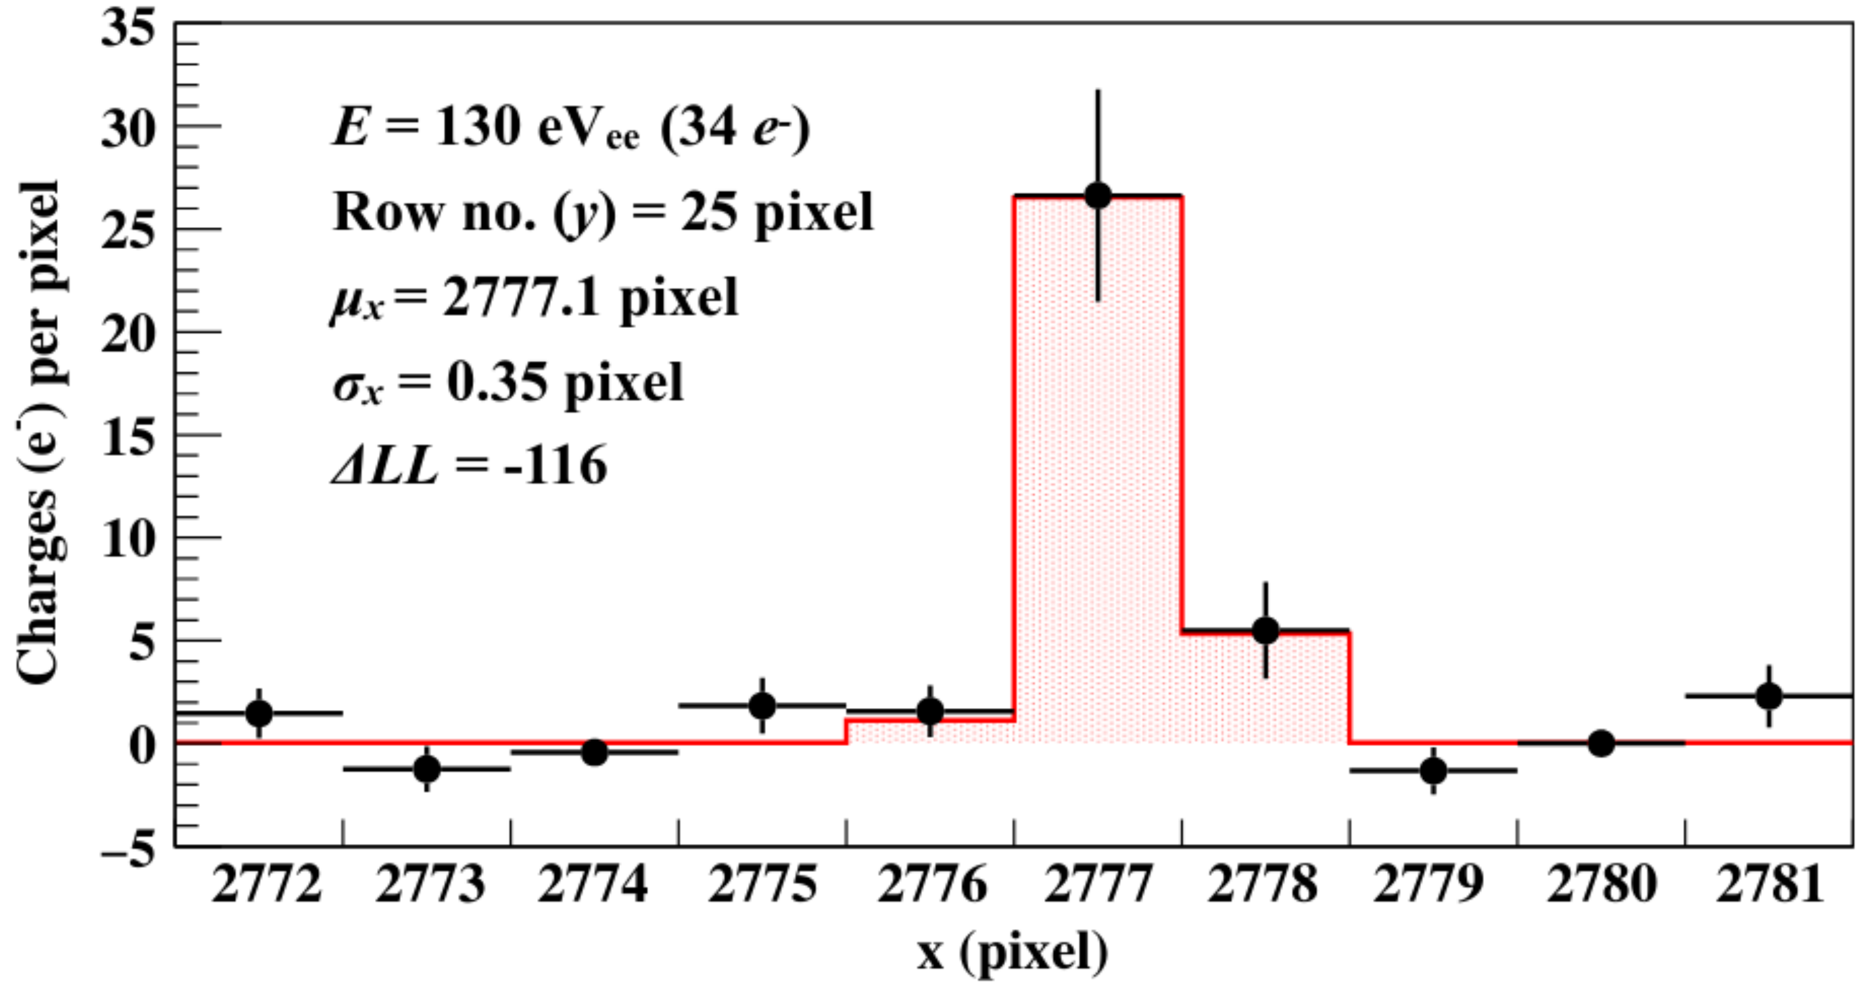
Exclusion limit: PRL125(2020)241803 **Full details:** PRD105(2022)062003

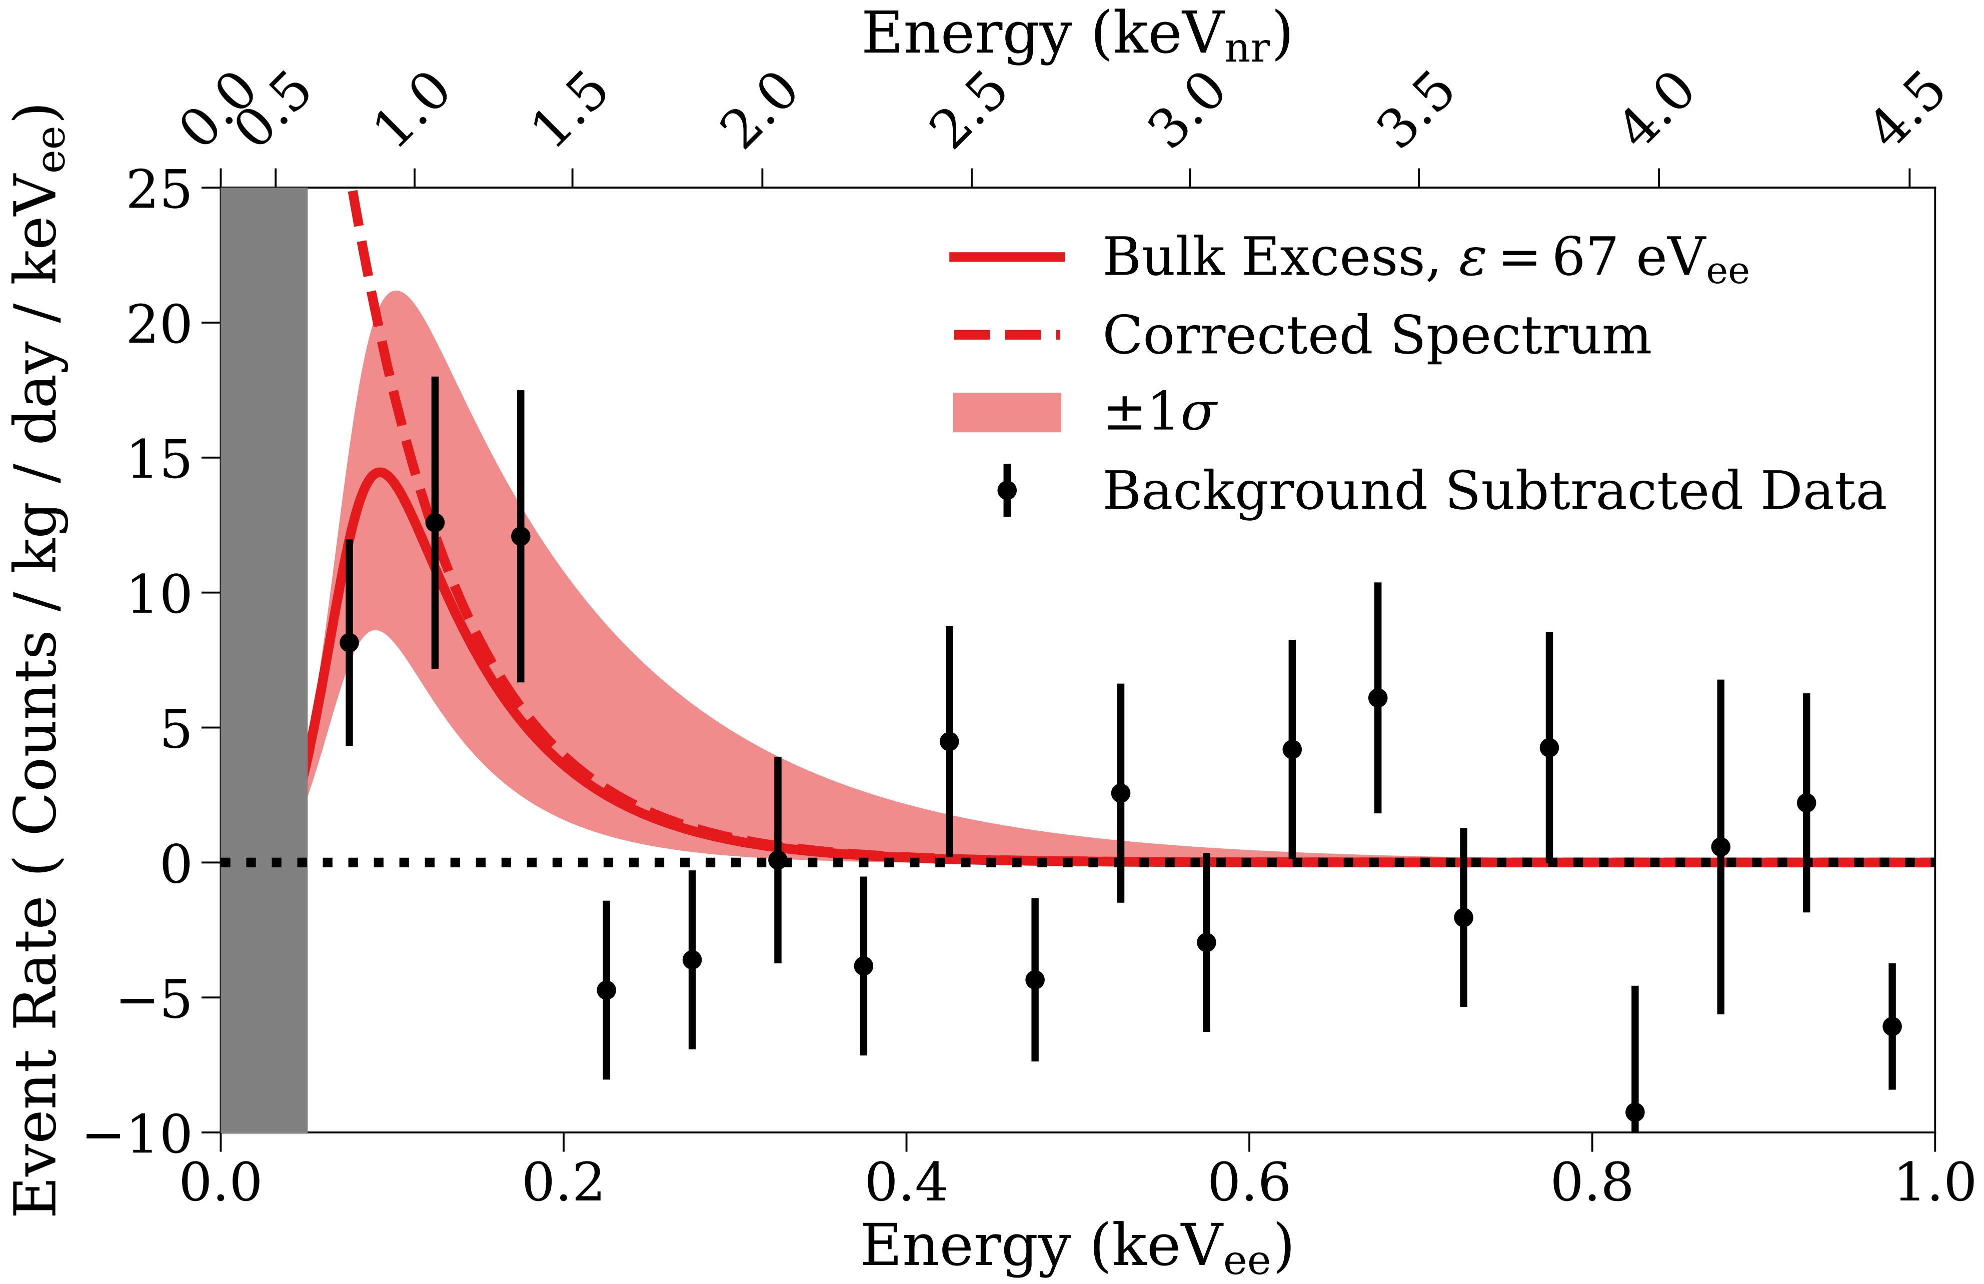


DAMIC Excess

A. Chavarria's talk

- Constructed full background based on extensive knowledge about radioactive background sources and detector response.
- Performed a fit to the data ionization events with the background model in (E, σ_x) parameter space.
- Excess of 17.1 ± 7.6 events with 50-200 eV_{ee}, 3.7 σ significance.
- If not addressed, limiting background for next generation experiments.





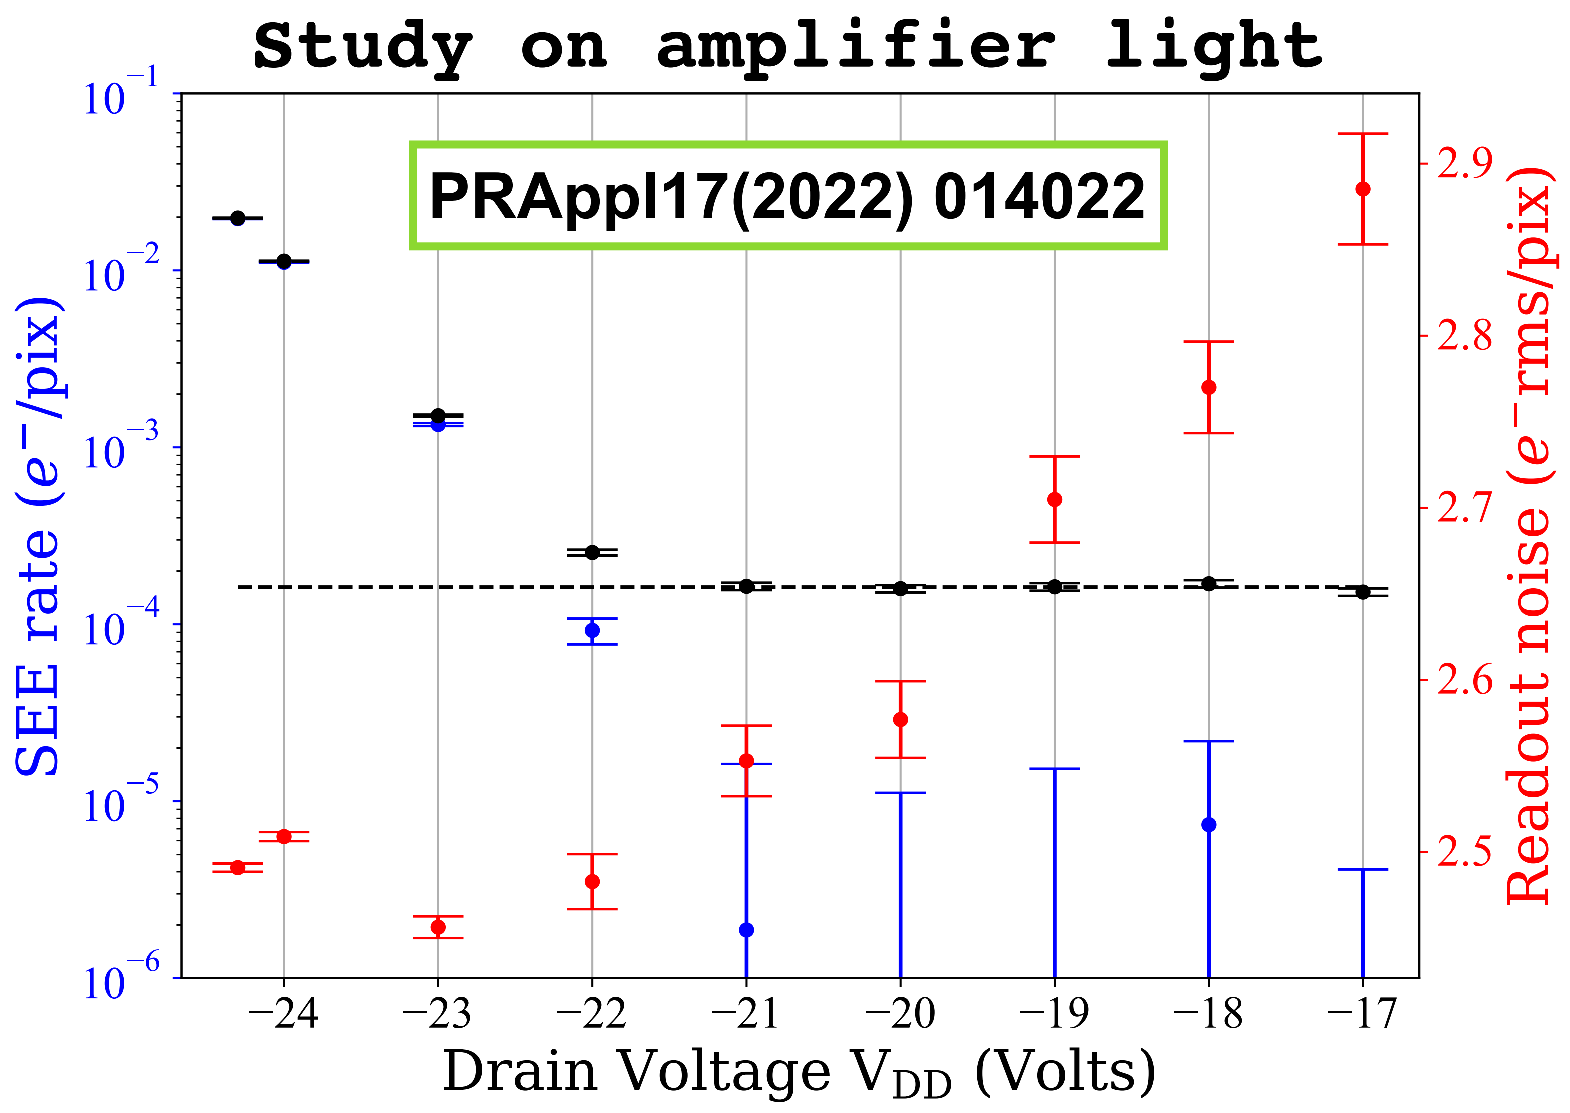
M. Cababie's talk

SENSEI

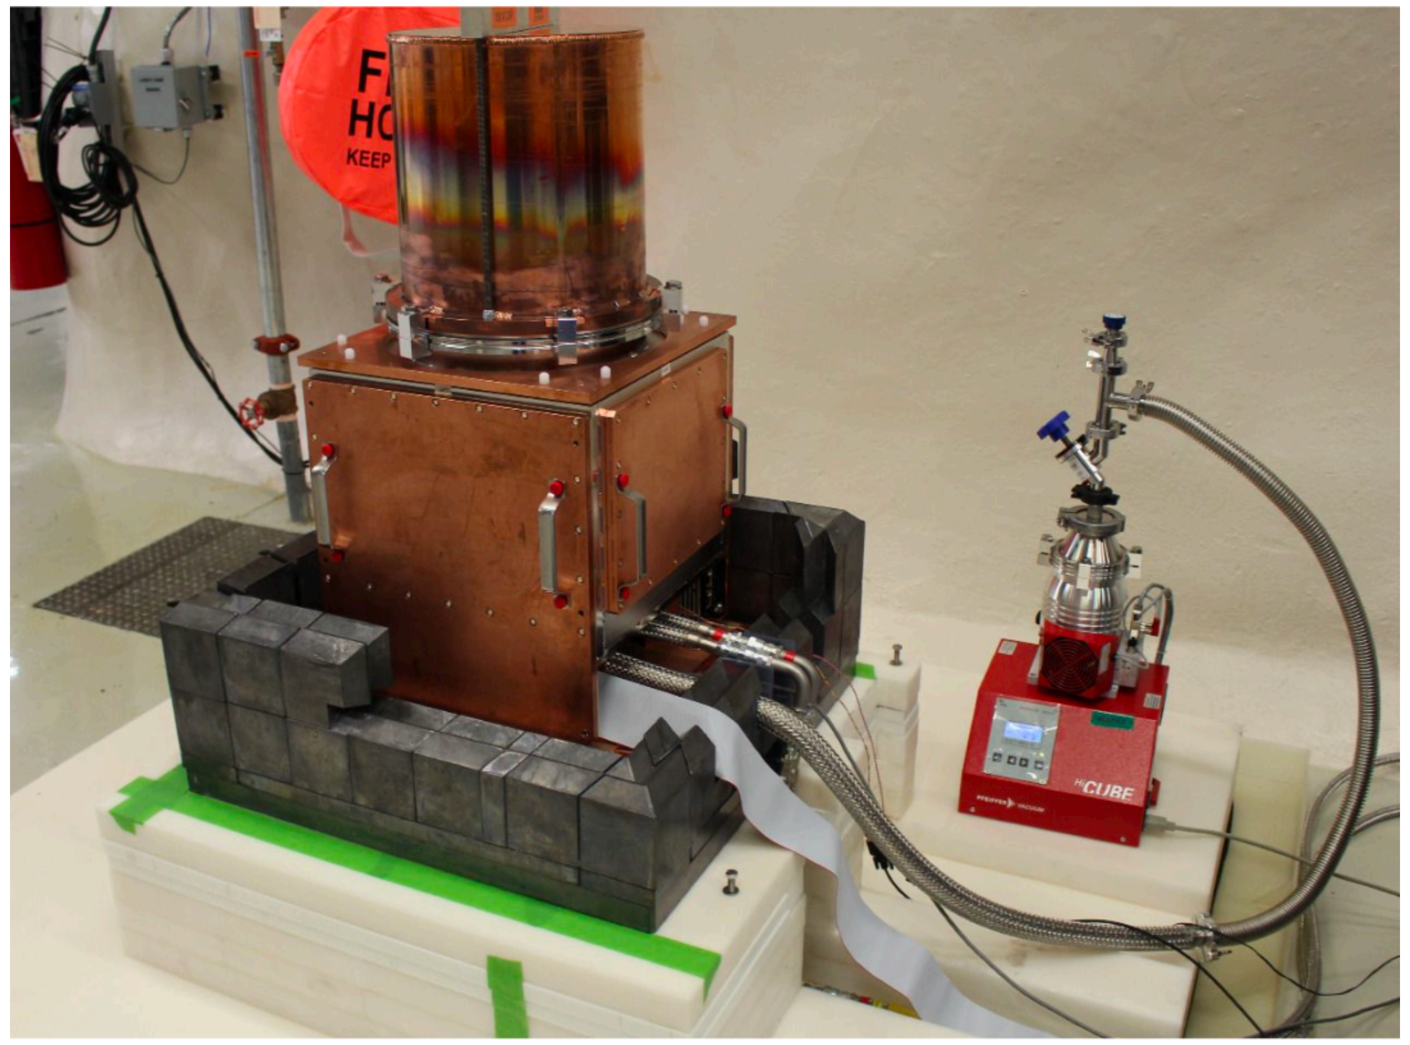
- **Research highlights:**

PRL125(2020)171802

  - First DM-search with skipper CCDs at Fermilab.
  - Experimental studies on instrumental effects to understand origin of single-electron backgrounds.
  - Simulation studies on physical origins of single-electron / photon backgrounds. PRX12(2022)011009

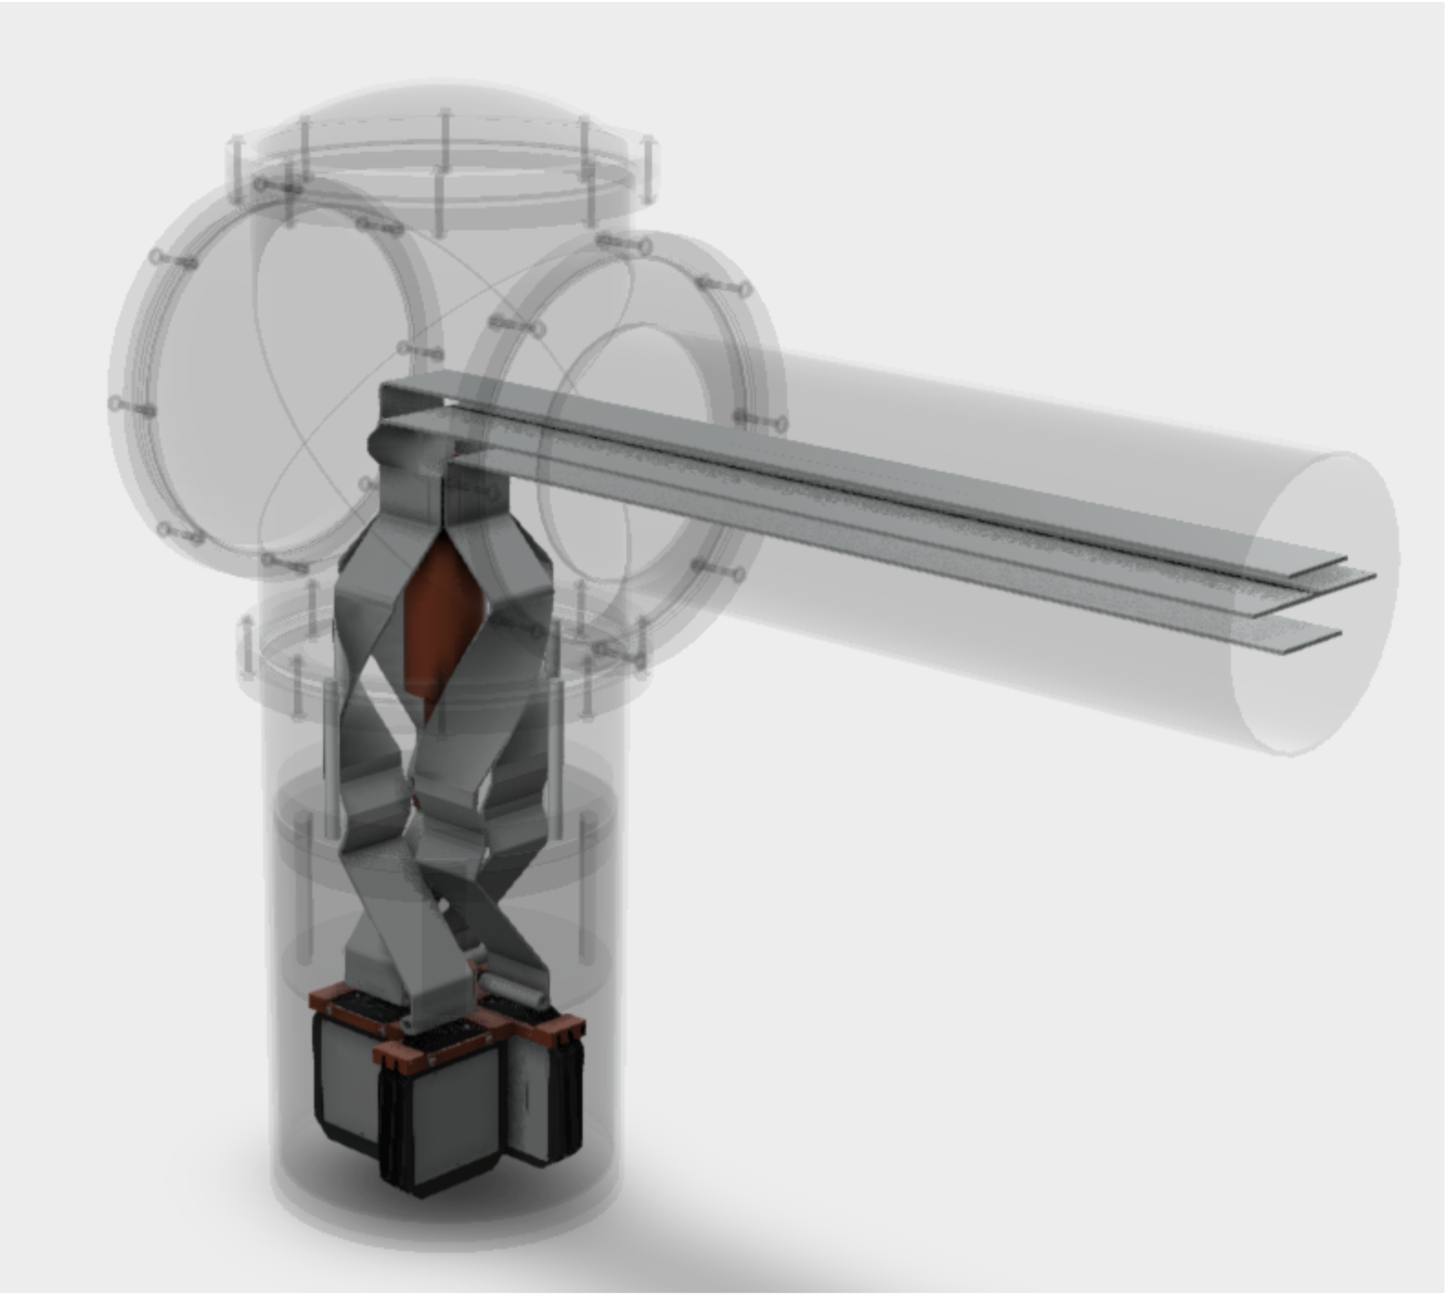


- **SENSEI at SNOLAB:**
  - 10 skipper CCDs (~25g) deployed already.
  - Performance test runs before science run!
  - Packaged and tested at Fermilab.
  - **Final goal:** 100 g traget with 5 d.r.u. background.



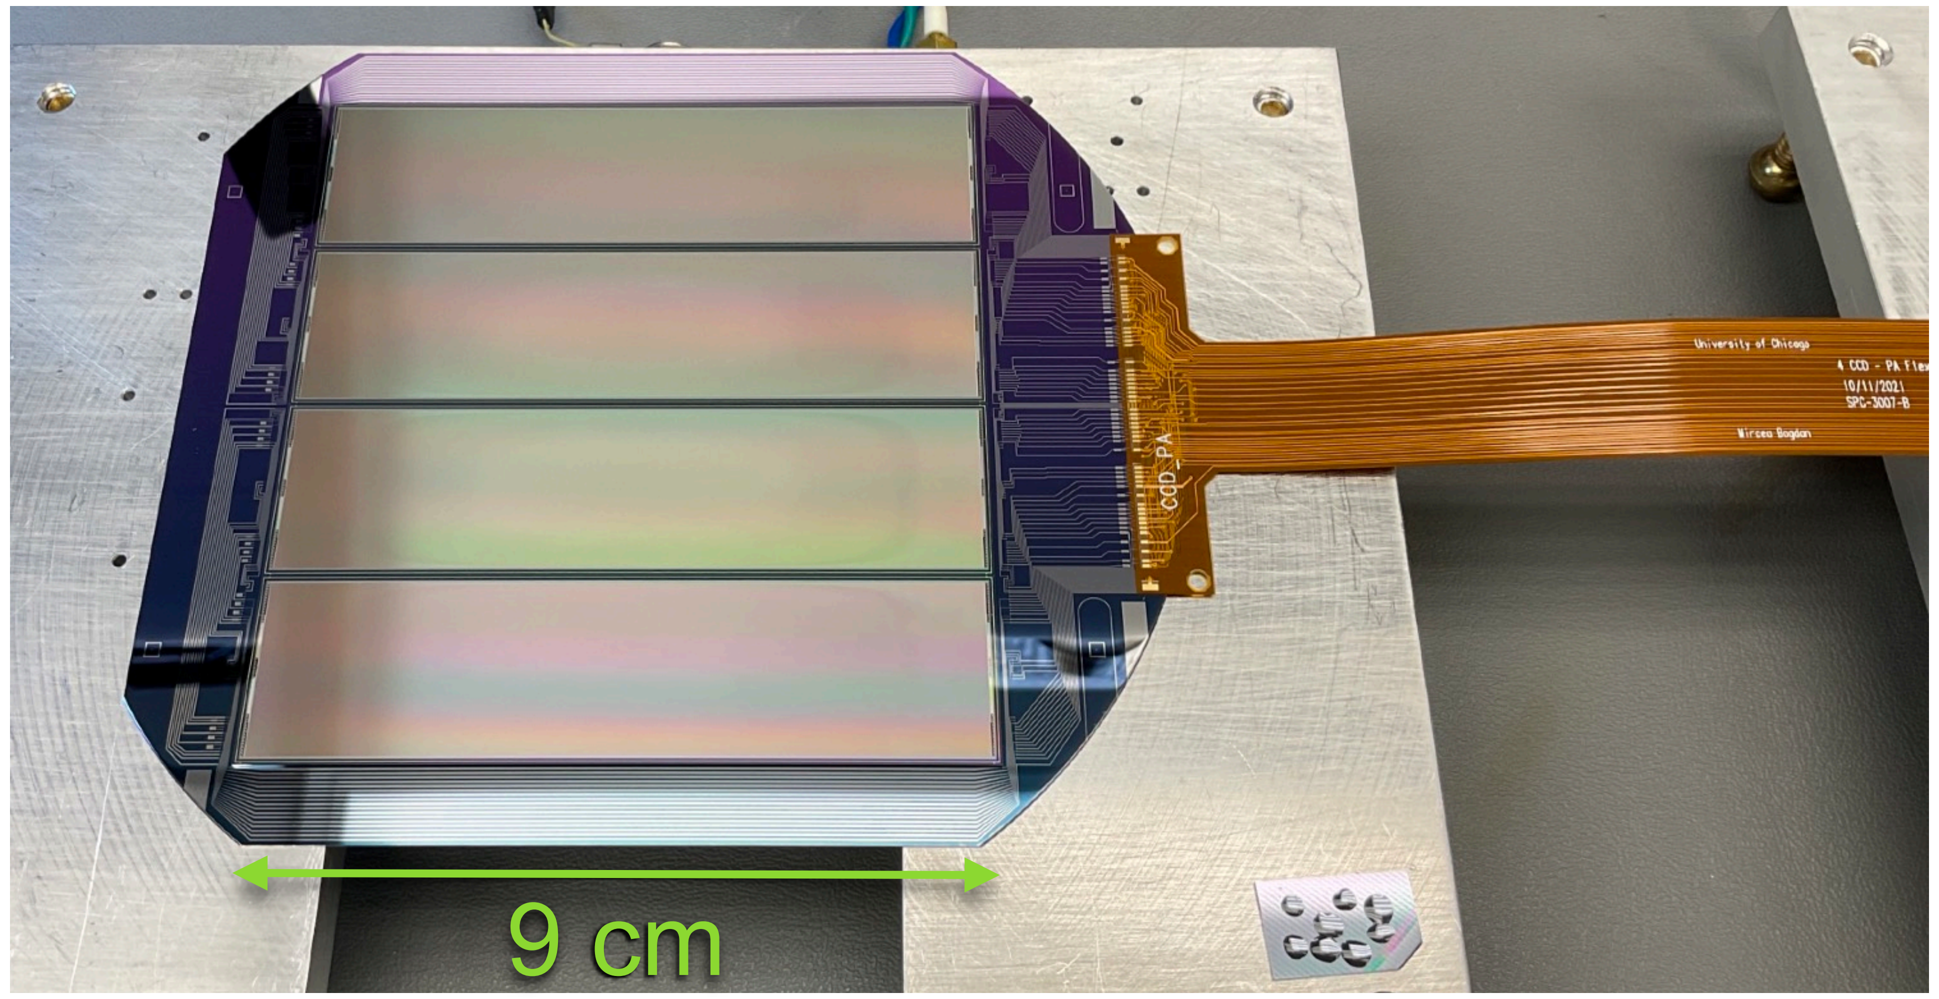
DAMIC-M

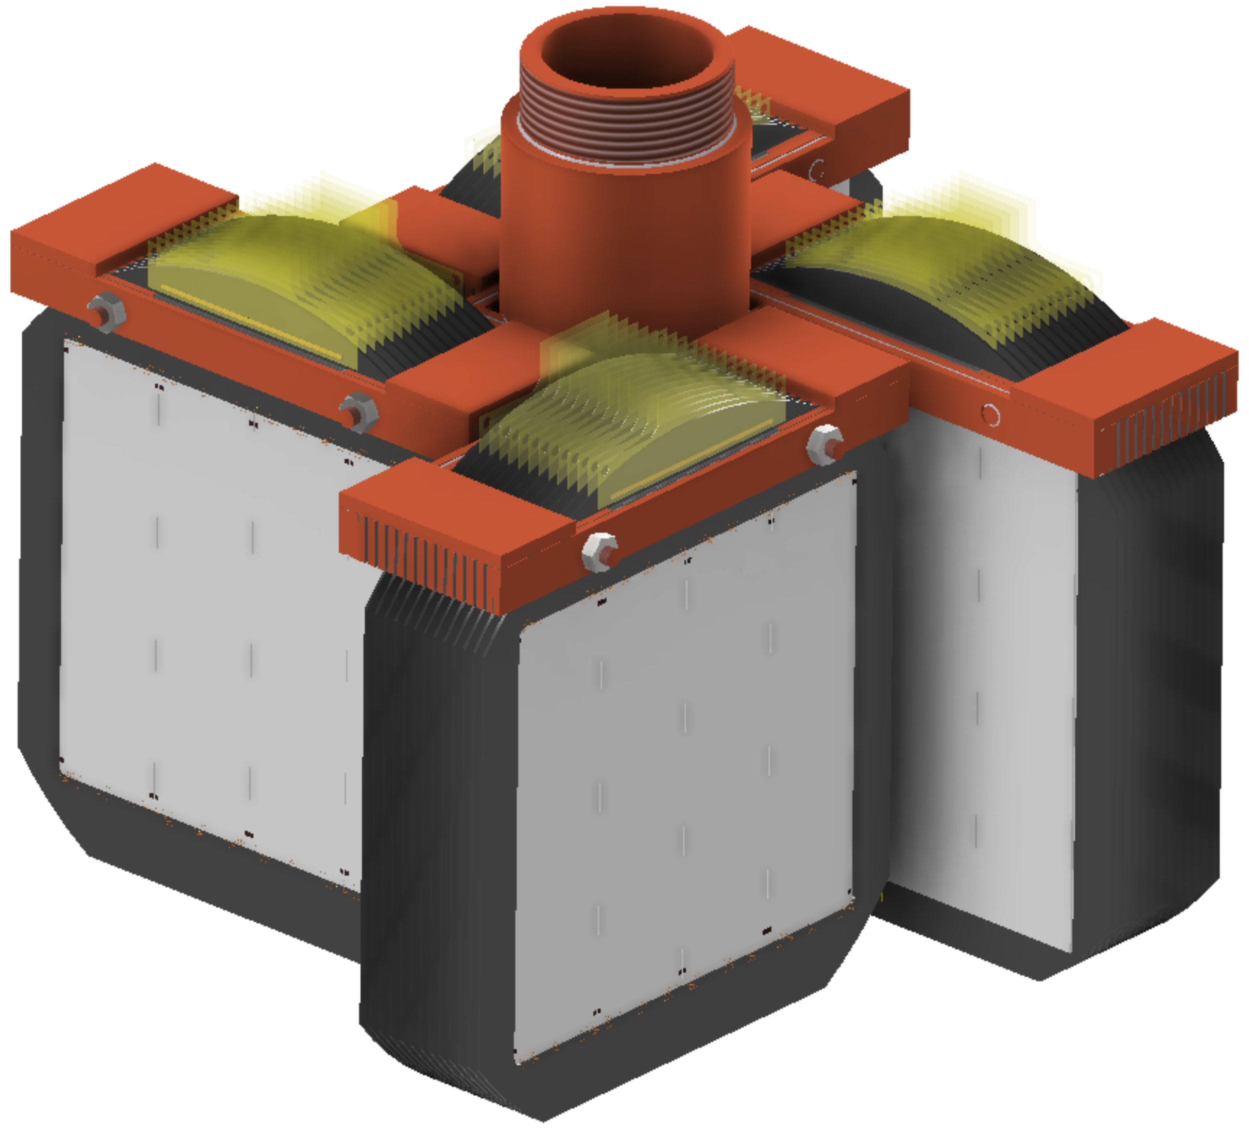
- 52 CCD modules in LSM (France) for kg-year target exposures.
- Skipper readout for 2 or 3 e^- threshold.
- Background reduction to a fraction of d.r.u. (improved design, materials, procedures).
- Main challenges: cosmogenic activation, surface contamination, backside CCD response.
- Besides ER searches, NR result may have comparable sensitivity to Si HV detectors of SuperCDMS SNOLAB.



Commissioning in early 2024

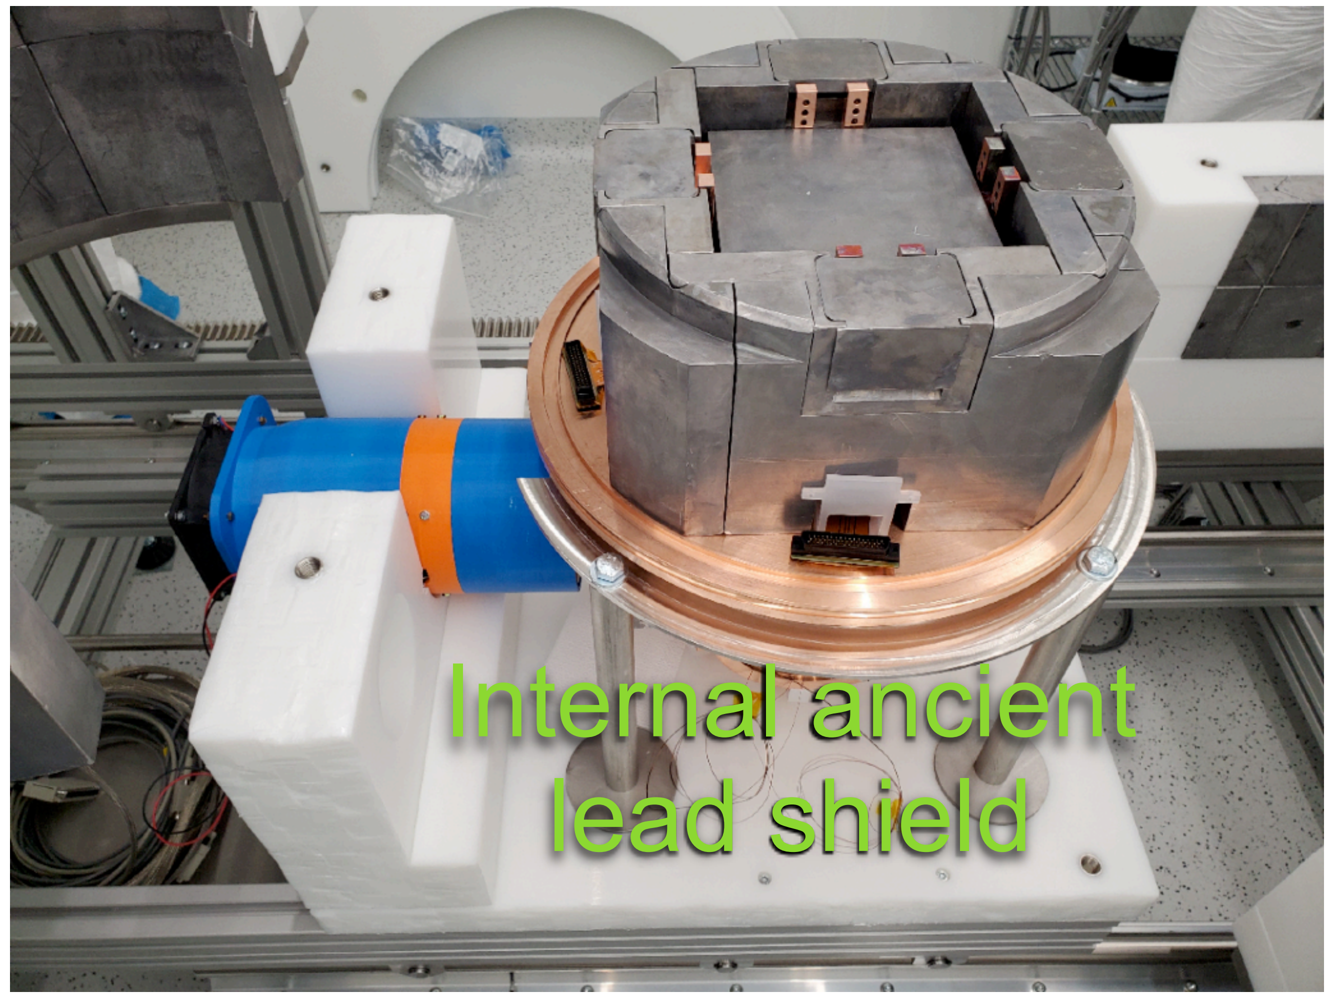
D. Norcini's talk





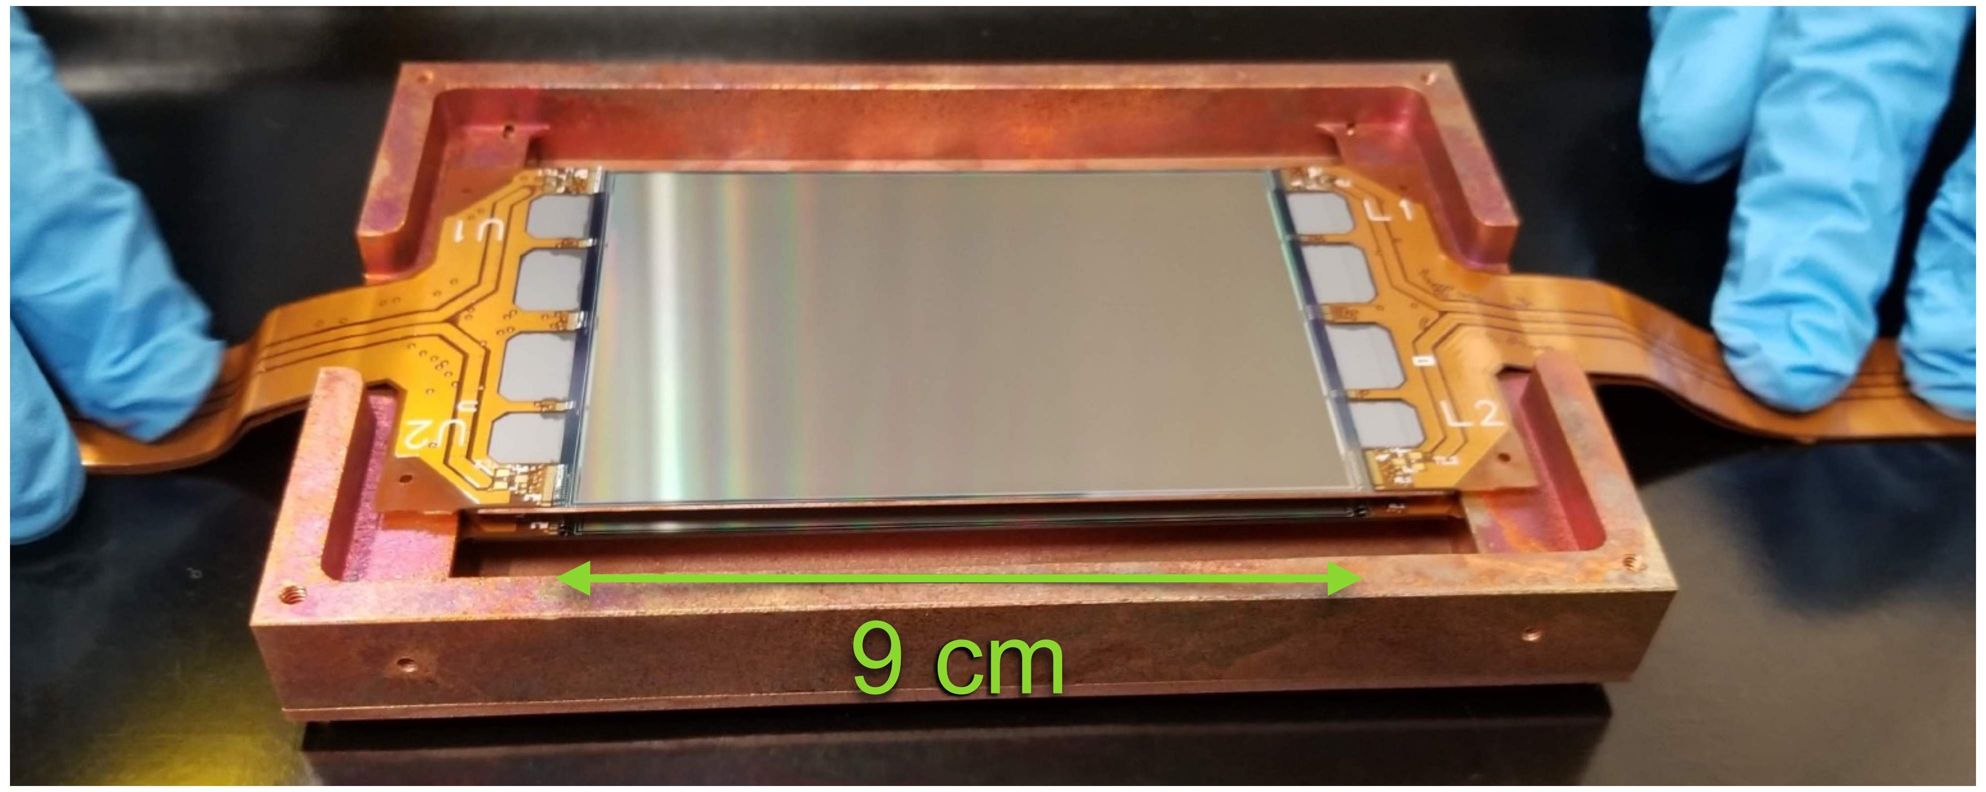
Prototype detectors

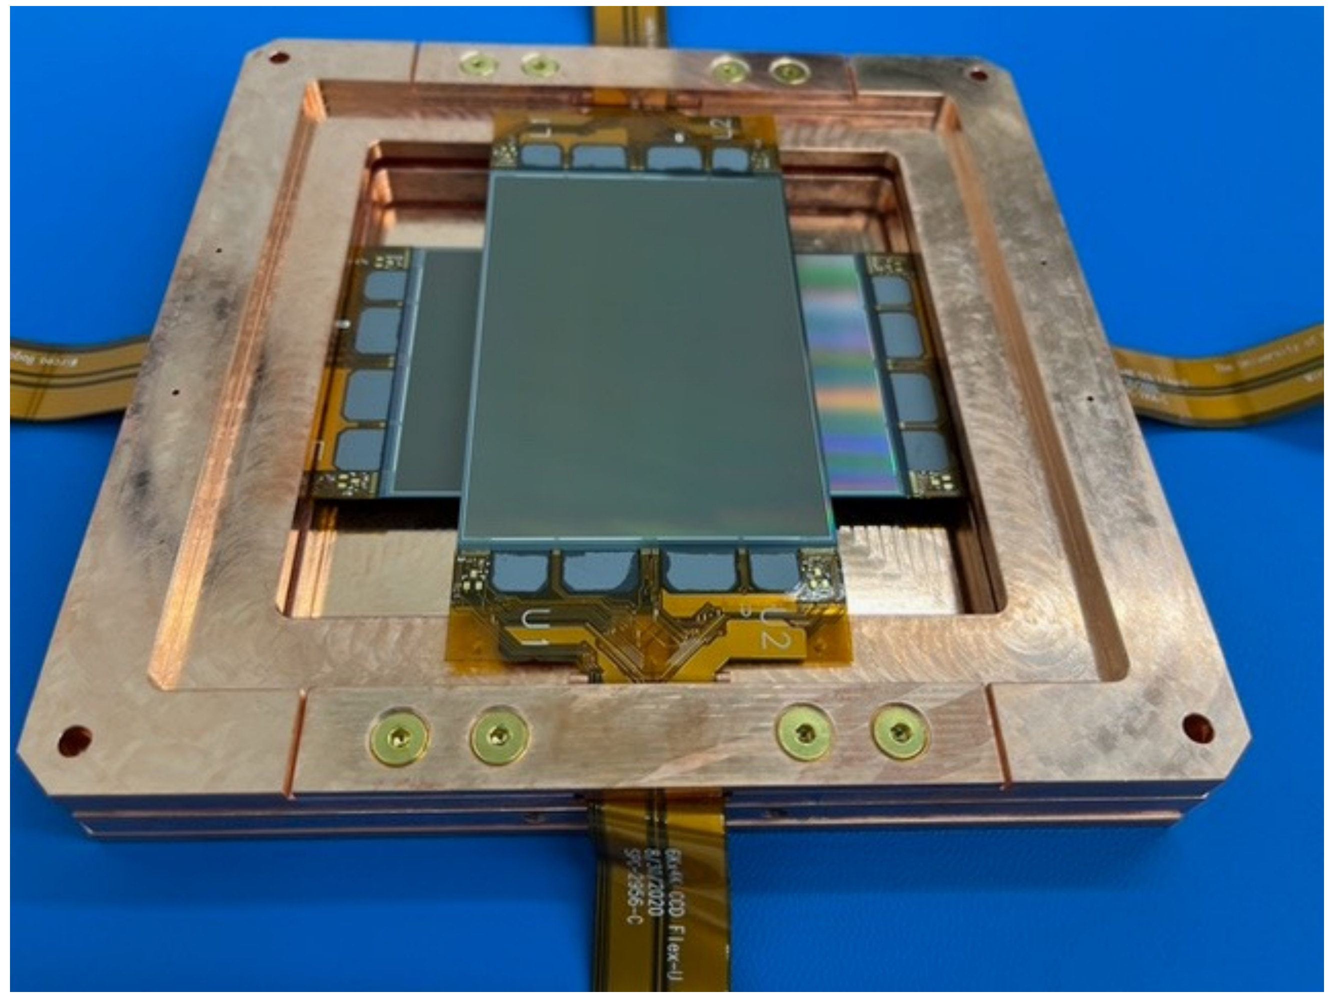
- Four 24 Mpixel DAMIC-M prototype skipper CCDs.
- Two deployed in DAMIC at SNOLAB, two in the LBC.
- Low Background Chamber (LBC) test setup for DAMIC-M at LSM for performance and background studies.
- Single-e^- resolution, 2 x 10^{-3} e^-/pix/day, 10 d.r.u., 18 g.
- Understand DAMIC excess, **DM search results**.



A. Chavarria's talk

D. Norcini's talk



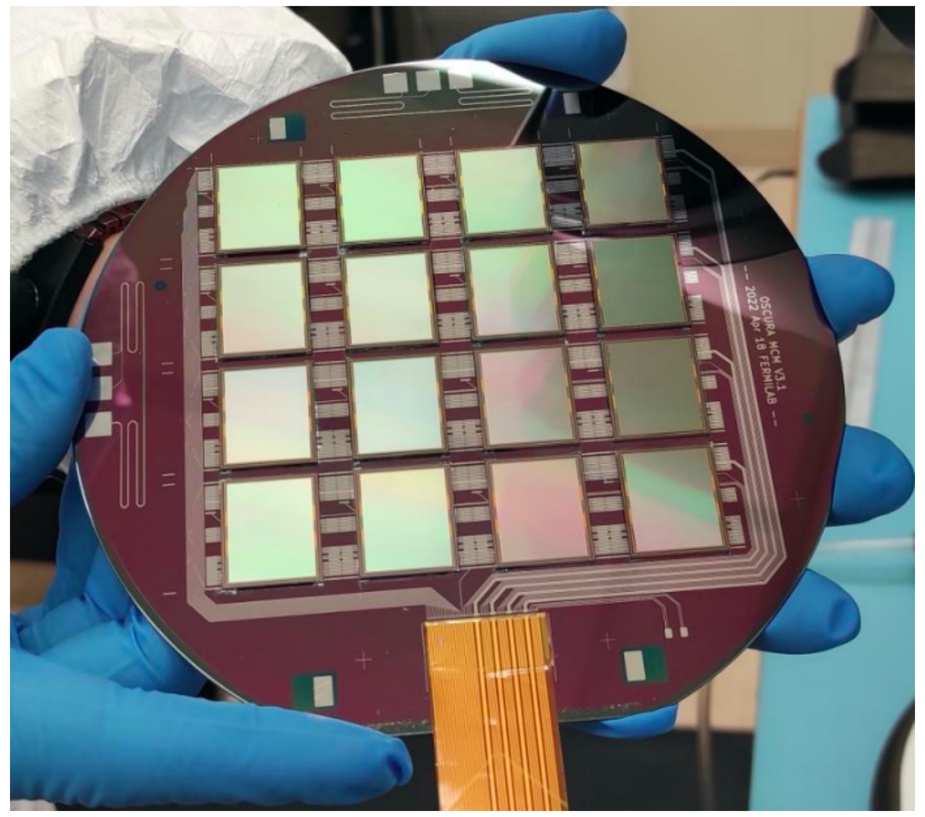


Oscura

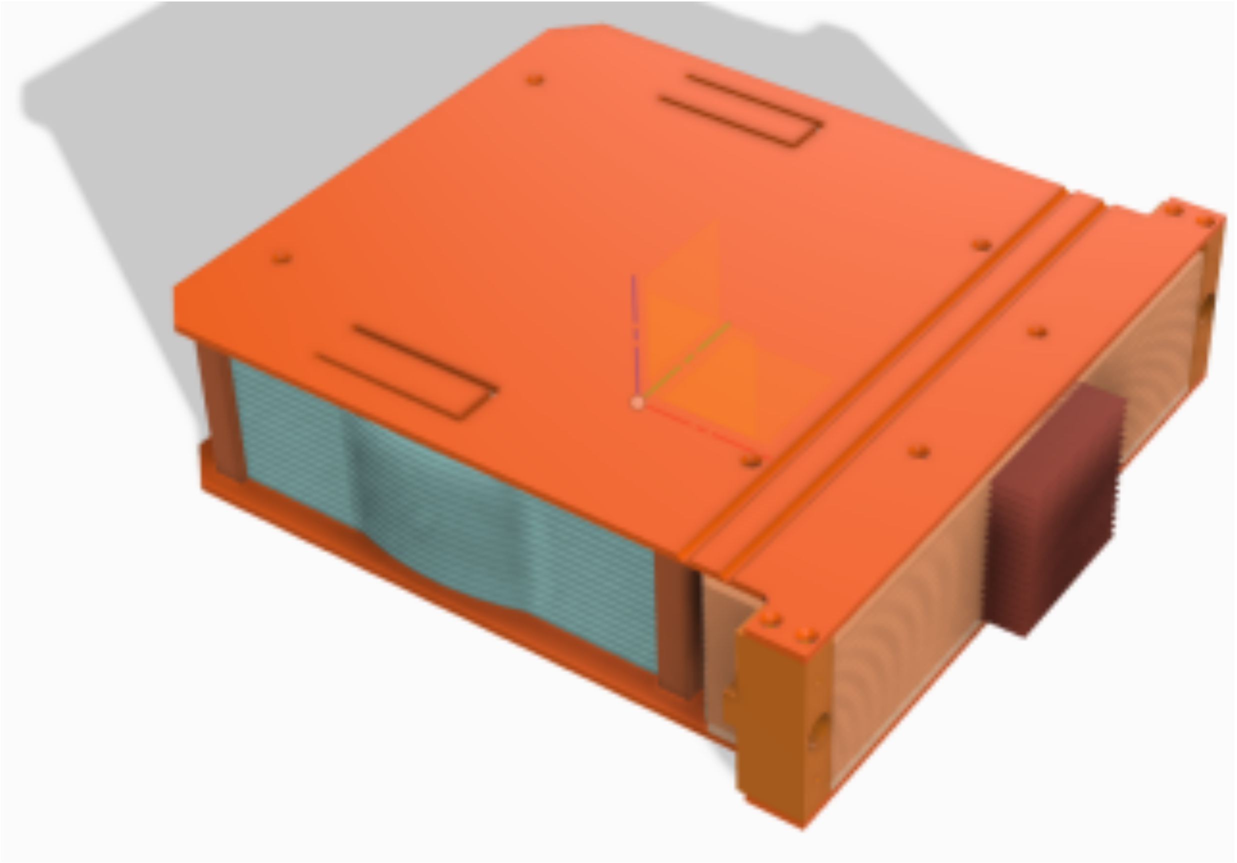
N. Saffold's talk

arXiv:2202.10518(2022)

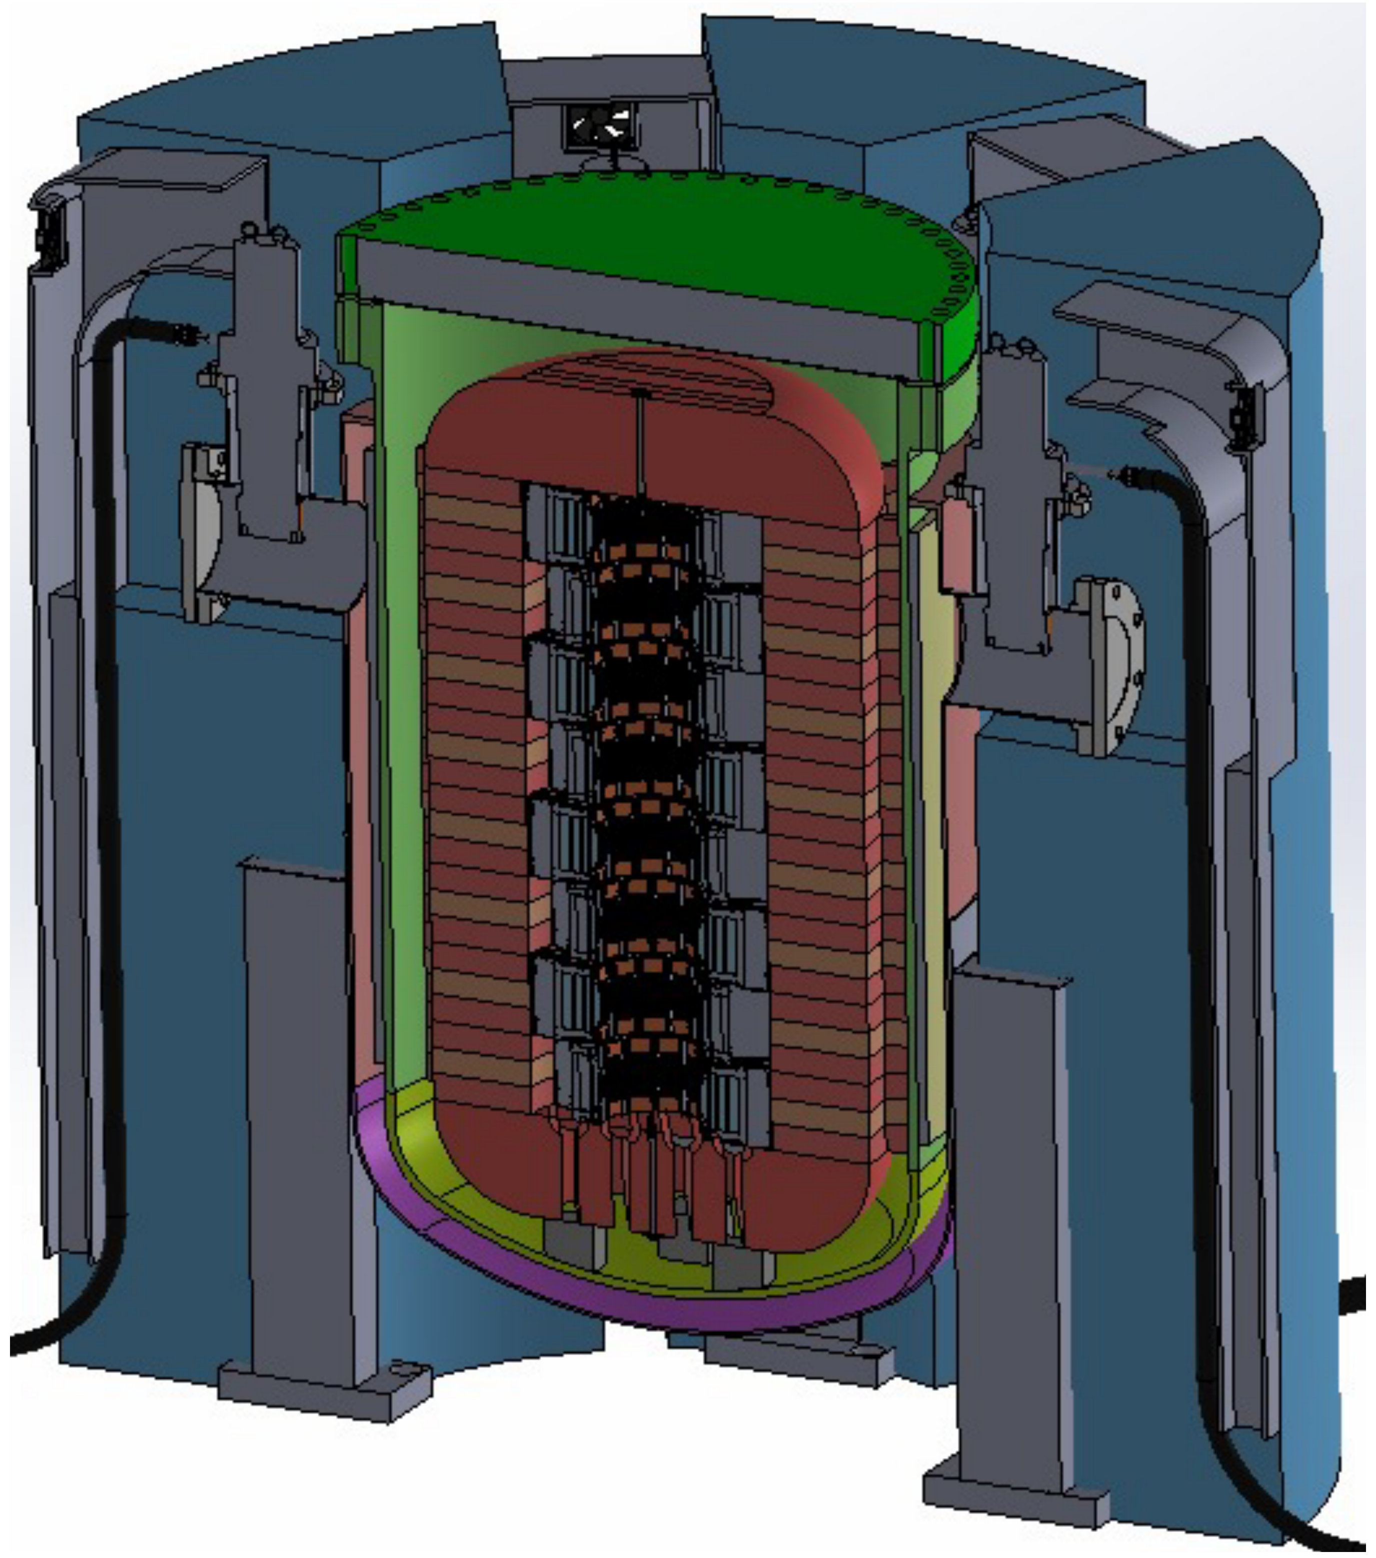
- **R&D**: scale the existing technology towards a 10 kg experiment.
- **Goal**: 30 kg-yr exposure with background level of 0.01 d.r.u.
- 28 Gpix in full Oscura instrument! c.f. LSST camera's 3.2 Gpix.
- Cold front-end electronics required for multiplexing and signal processing from ~24,000 channels.



16-CCD Multi Chip Module (MCM)



Super Module (SM): 16 MCMs in EFCu



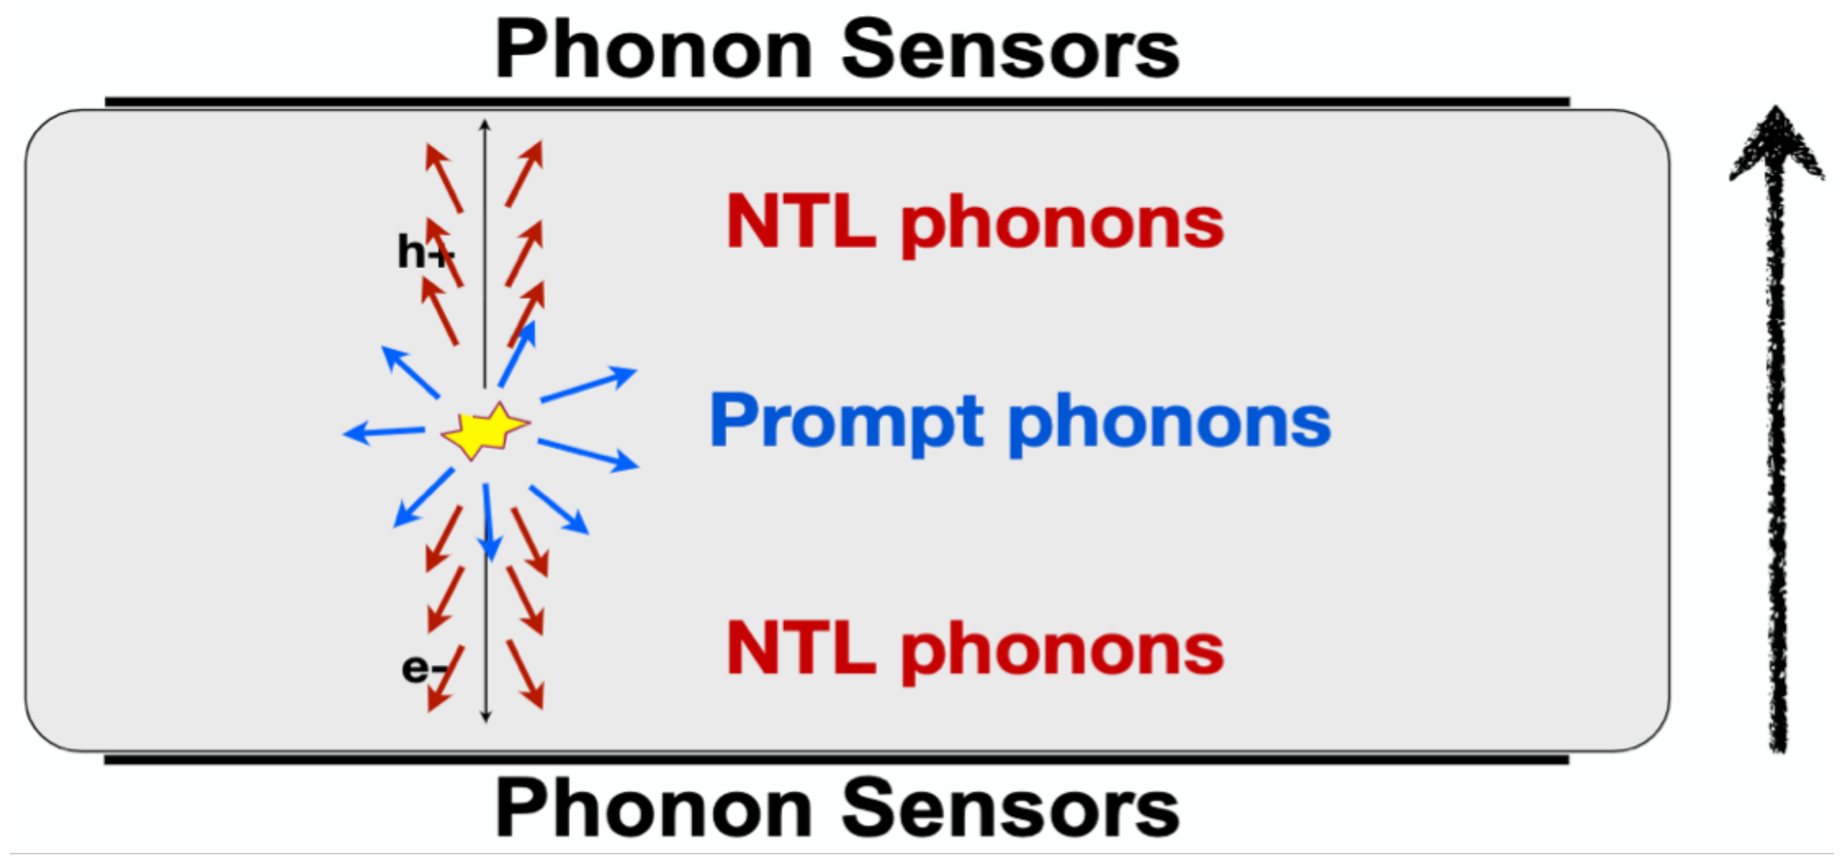
Full payload 100 SMs: 10 kg!

SuperCDMS / EDELWEISS HV

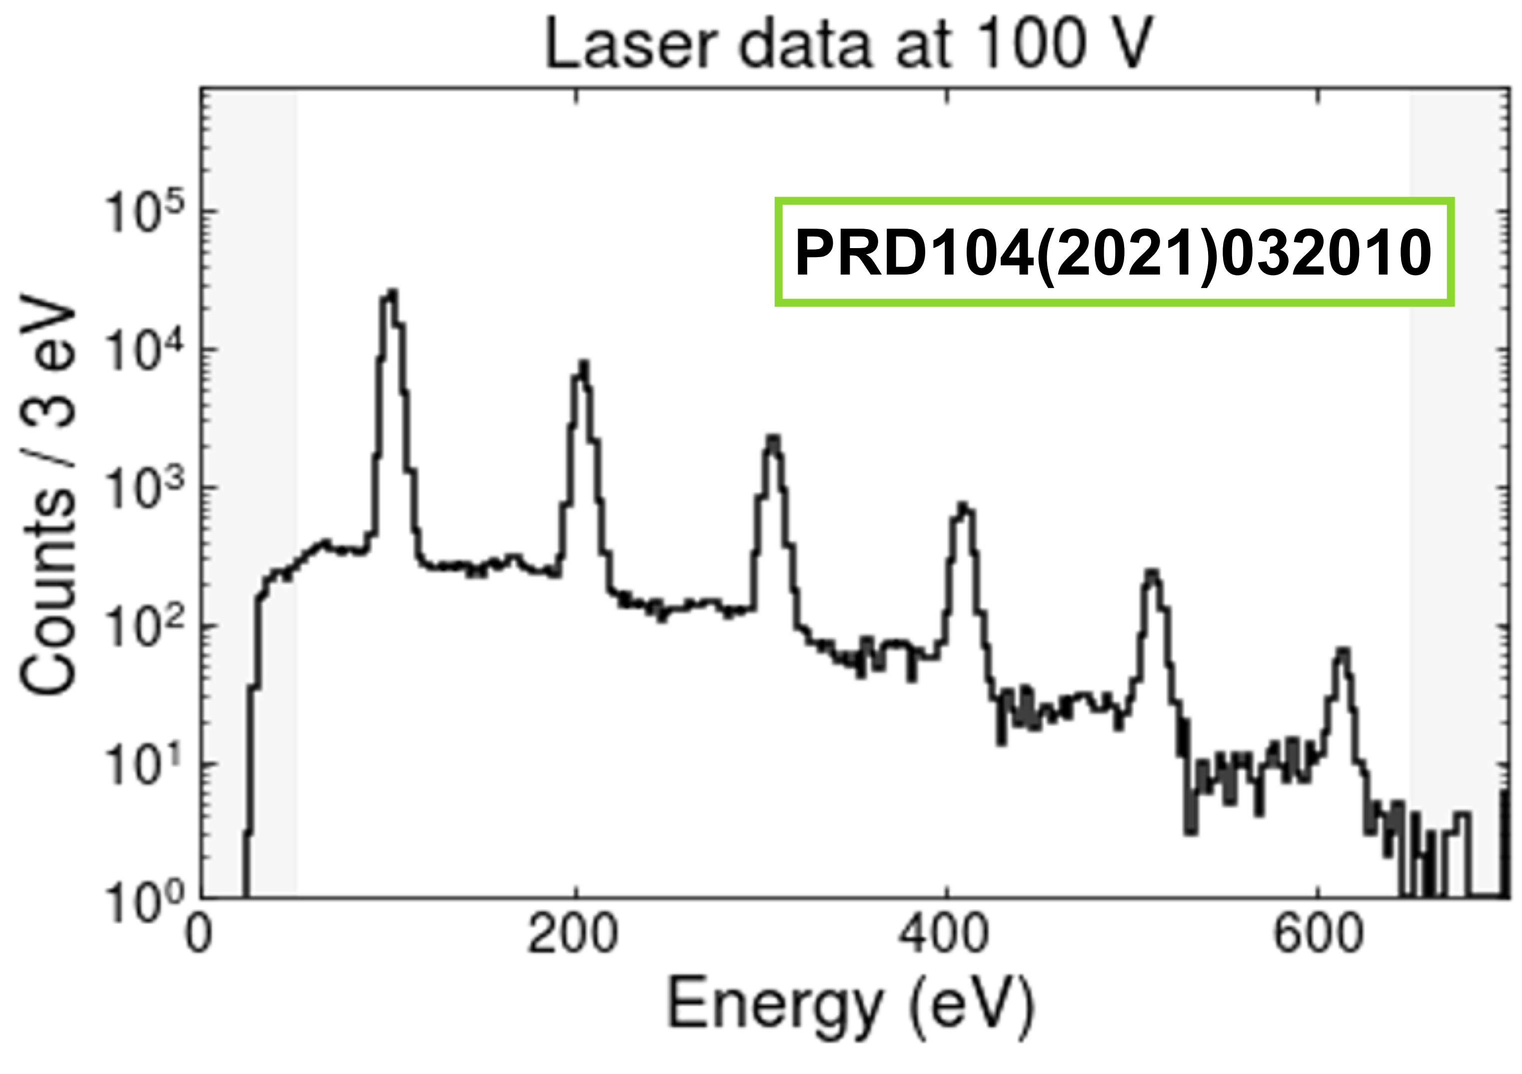
- Cryogenic calorimeters.
- Amplification of heat signal from charges drifting in electric field:

$$E_{heat} = E_{recoil} + E_{Luke} = E_{recoil} + N_p \, \Delta V$$

$$E_{heat} = E_{recoil}\left(1 + \frac{\Delta V}{\epsilon}\right) \quad \textit{particle-ID dependent}$$



- Amplification proportional to ionization signal and to applied bias
- No ER/NR discrimination as heat is dominated by ionization signal.
- Heat-only events are a source of backgrounds.
- Strategies to reject surface events: multiple electrodes, timing.



(= Recoil energy + Neganov Luke effect gain)

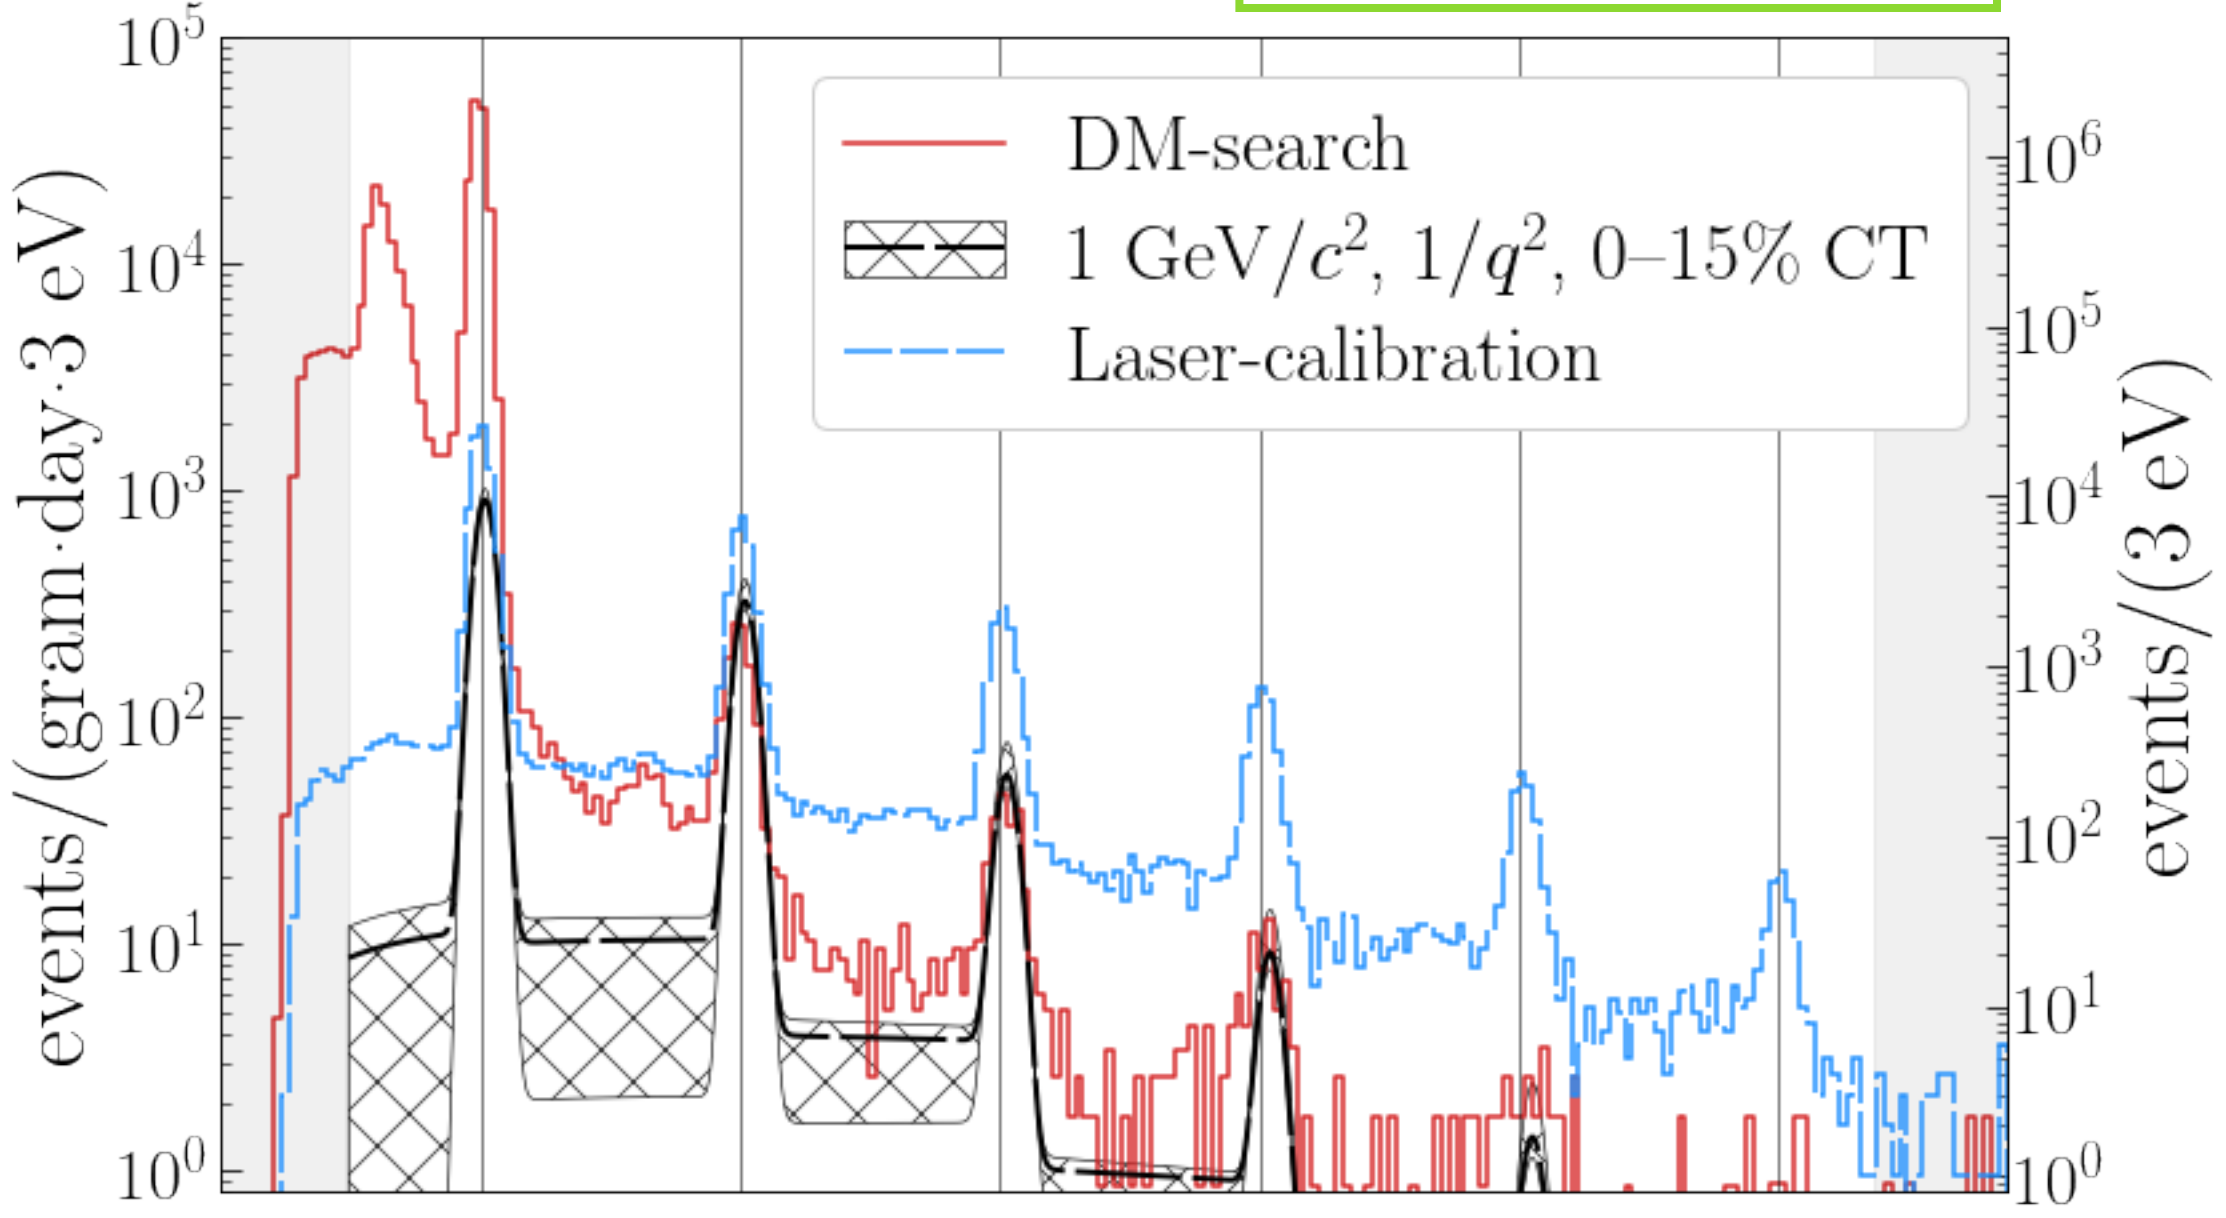
SuperCDMS HVeV

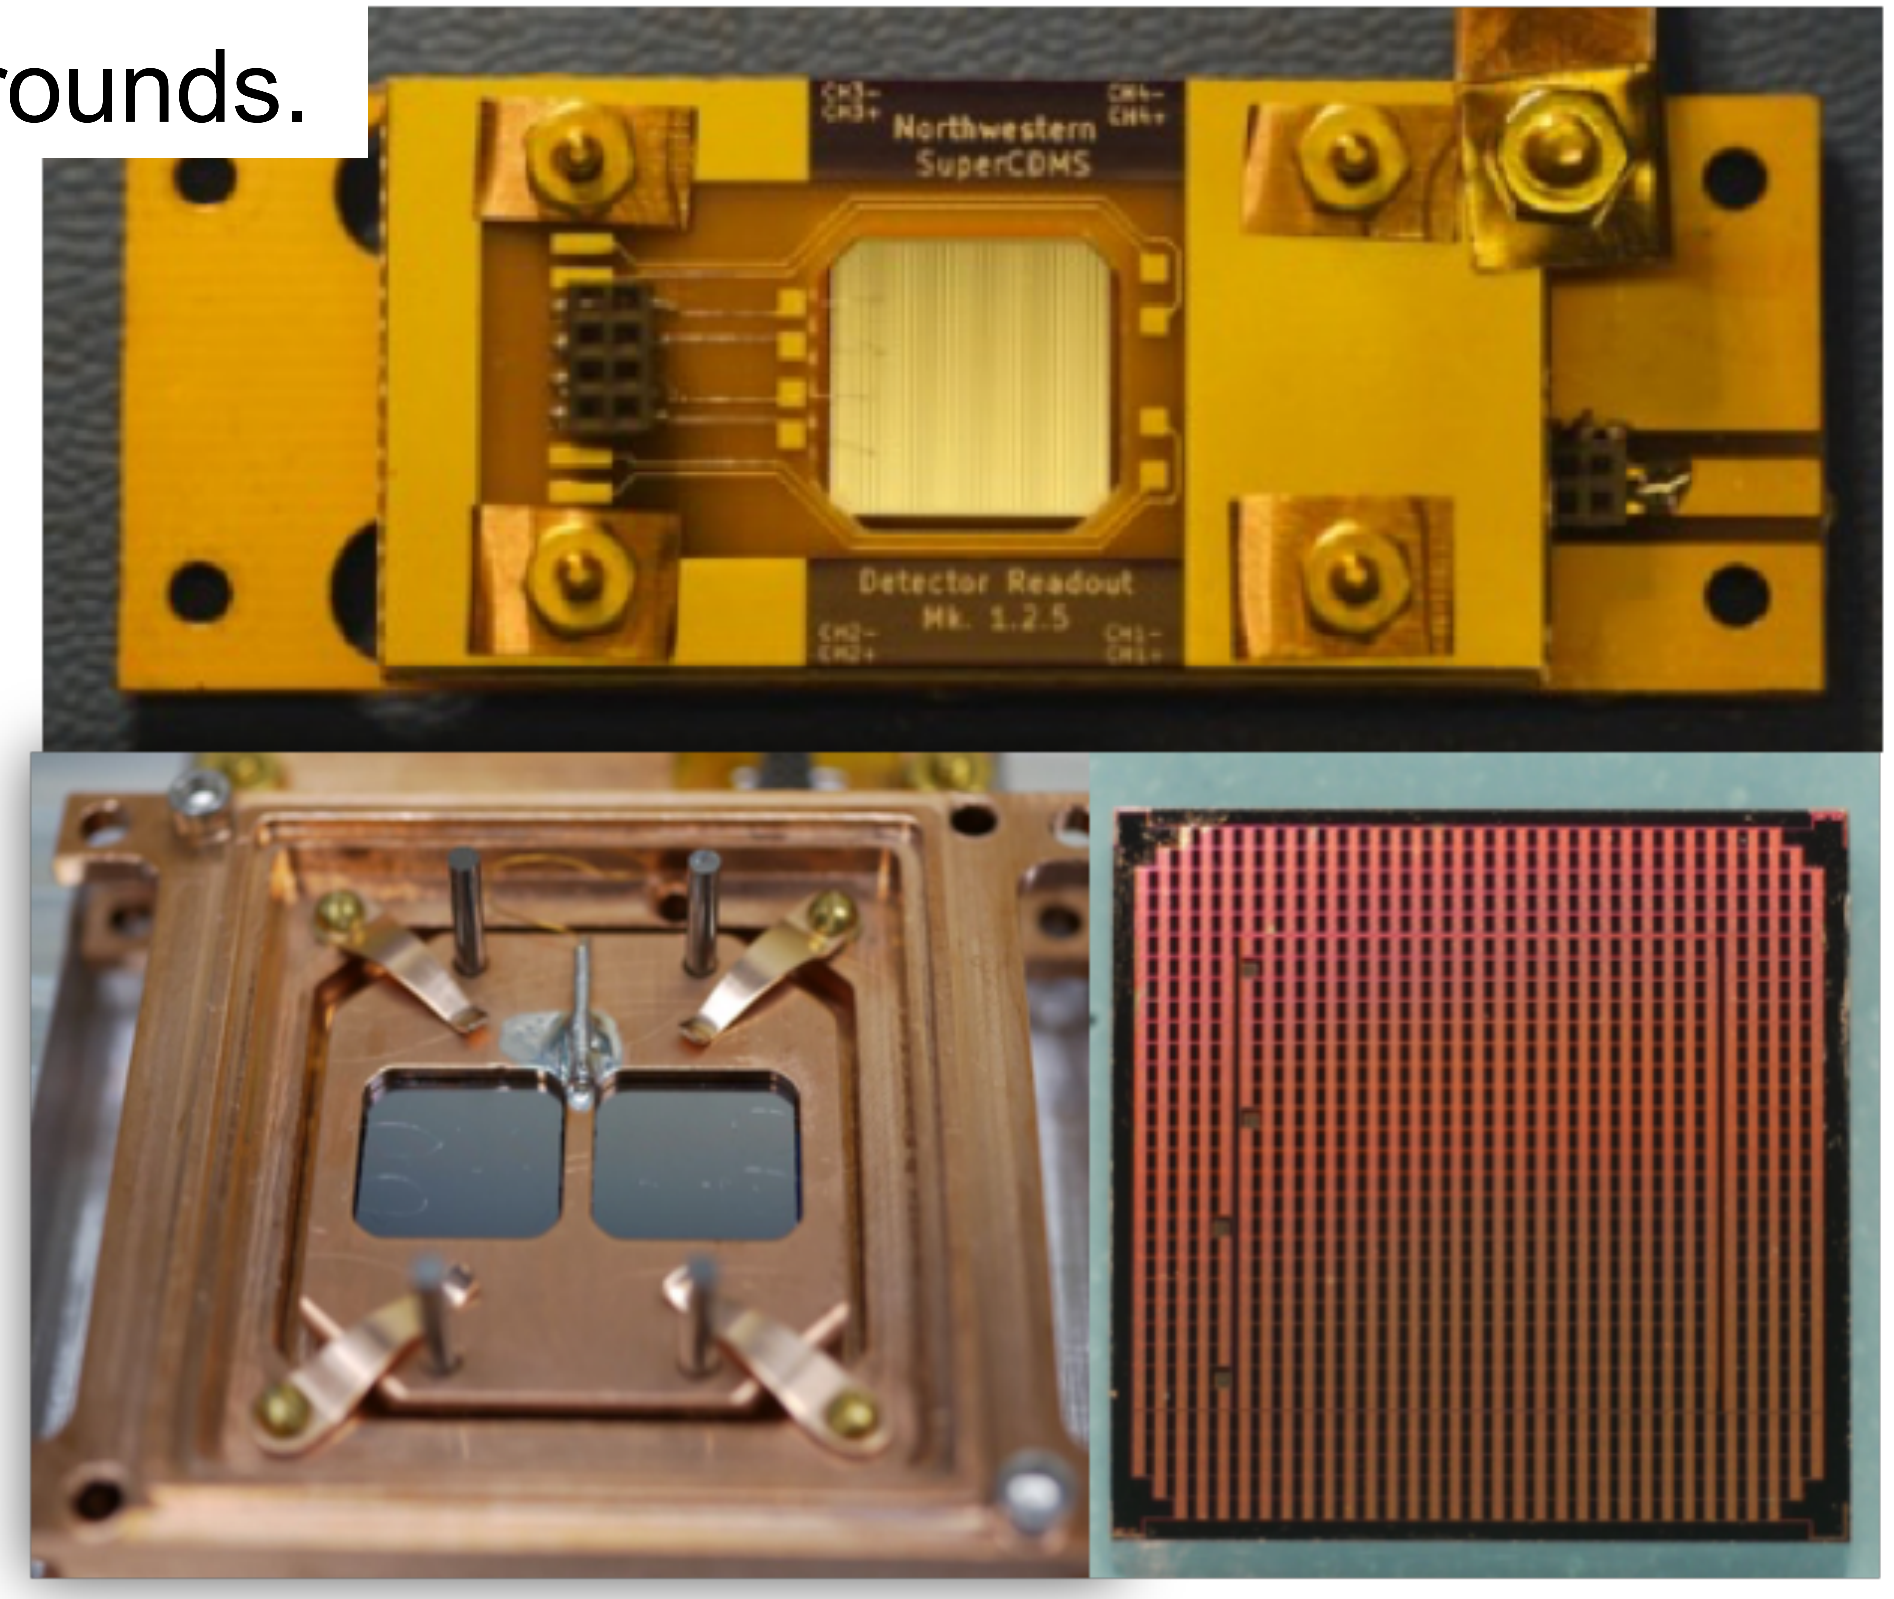
- HVeV detectors "best in class:" 2.7 eV baseline resolution, 9.2 eV threshold, large dynamic range, 1-g target.
- Running underground in NEXUS at Fermilab (300 m.w.e.)
- Four science runs with progressively lower backgrounds.

V. Novati's talk

M. Wilson's talk

PRD102(2020)091101(R)





EDELWEISS

H. Lattaud's talk

- RED30: 42 eV baseline resolution, 0.53 e-. Operated underground at LSM.
- Better exclusion limit than SuperCDMS HVeV because of larger exposure, lower surface-to-volume and lower background environment (despite x10 noisier).
- Plans for CRYOSEL: 30g Ge detector, σ_{phonon} = 20 eV, sustaining 200 V bias.

Conclusions

- Electronic recoil searches allow us to search for even lighter DM.
- For DM-e scattering, ~MeV masses. Also Migdal, DM absorption.
- Require sensitivity to only a few charges ionized in the target.
- CCD detectors are scaling to kg-scale targets with single-charge resolution and correspondingly low backgrounds.
- Significant progress in single-charge resolution in cryogenic calorimeters.
- Active experimental program with orders-of-magnitude improvement in sensitivity in the coming years.

Thank you!
