

Using Deep Learning to Enhance the Particle Identification Abilities of the Transition Radiation Tracker

Geoff Gaugler | Mark Kruse | Duke University

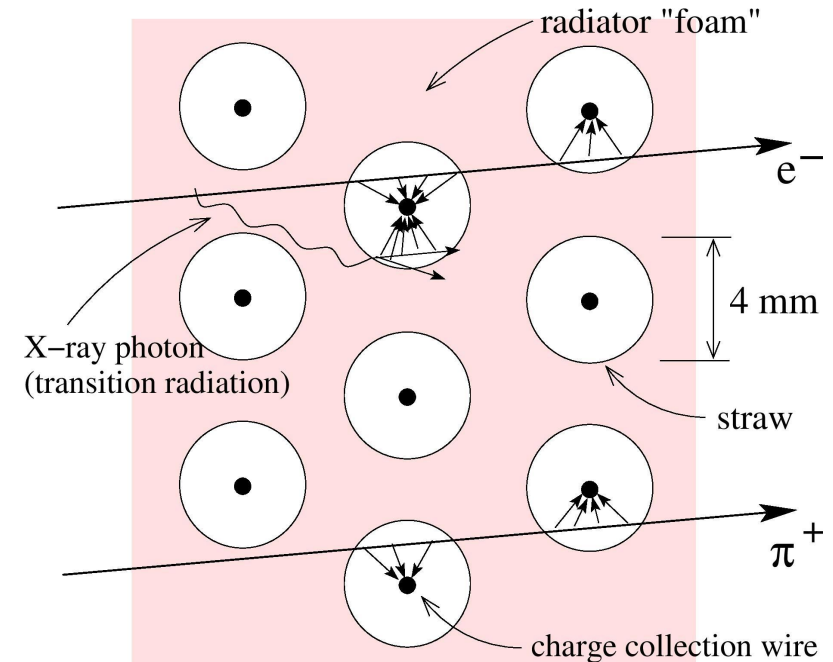

Background - the TRT

Structure

- 350,000 straw tubes filled with an ionizing gas
 - Run I: all xenon
 - Run II: mixture
 - Run III: likely all argon
- Seated in a radiator foam
- Wire in center of each straw

Particle identification (PID)

- Utilize transition radiation
- Mostly to distinguish pions from electrons
- Happens when $\gamma > \sim 1000$
- $E = \gamma mc^2$
- E.g. for electron: $m = .5 \text{ MeV}$ corresponds to $E > .5 \text{ GeV}$
- For pion: $m = 140 \text{ MeV}$ corresponds to $E > 140 \text{ GeV}$

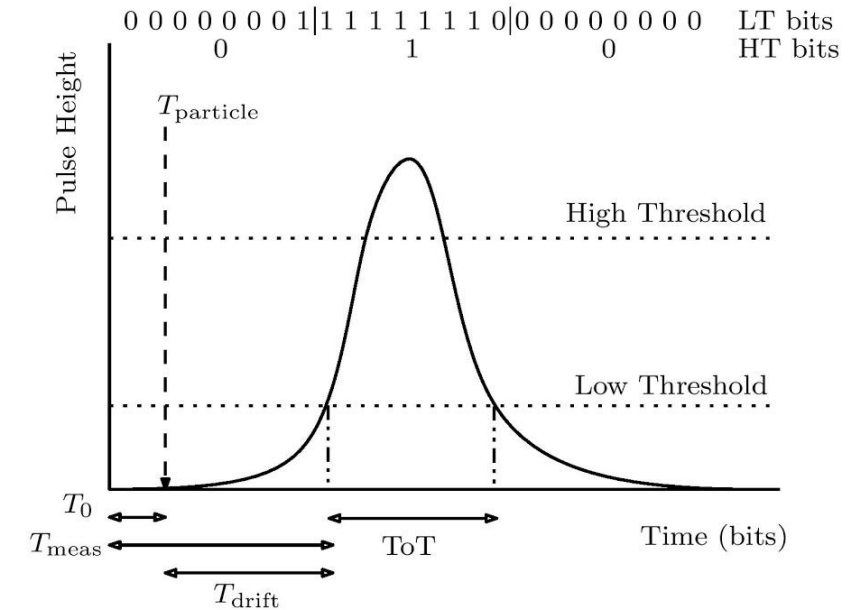

Background - the TRT read-out Bitpattern

How do we use this?

- Precise charge collection measurement not recorded
- Two thresholds: 300 eV (low) and 6 keV (high)
- 75 ns time window per straw
 - 24 low threshold 3.125 ns time bins
 - 3 high threshold 25 ns time bins

The bitpattern

- For each time bin: 1 if signal surpasses threshold, 0 if not
- Result: 'TRT bitpattern'
- Bit pattern depends on the particle type, gas used, and particle momentum and direction
- Time over threshold = the time a pulse height is above 0 for LT

Background - motivation

Problems created by gas geometry for run III

- Xenon easily ionizes TR photons, giving HT hits for electrons but not for pions
 - ...but expensive!
- Gas leaks -> switch to much cheaper argon
- Argon less sensitive to TR photons -> HT hits less consistent for electrons -> **bad for PID**

Current PID method - eProbHT tool

- Uses HT hits, track occupancy
- Significant performance drop
 - .89 vs. .71 AUC

$$\mathcal{L}^{e,\mu} = \prod_{\text{TRT hits}} \begin{cases} p_{\text{HT}}^{e,\mu} & \text{if HT hit} \\ 1 - p_{\text{HT}}^{e,\mu} & \text{else} \end{cases}$$

What variables not affected by this problem could be useful?

$$\varphi^e = \frac{\mathcal{L}^e}{\mathcal{L}^e + \mathcal{L}^\mu}$$

Approach

Many properties of hit extracted from low threshold bit pattern

- Using just these variables -> lose other info contained in entire BP
- Any discriminating power in LT BP?
 - E.g. ToT length, ToT 'islands', correlations of patterns between straws
- We don't know what we don't know!

Treat LT bit patterns as images

- 2D array - 20 bits in each bit pattern, ~40 hits per track
- Computer vision techniques on LT BP - CNNs
- Feed hit-level variables into LSTMs (gas type, R of hit, etc.)
- Feed track-level ones into FCNs (track occupancy, track η , etc.)
- Using simulated $Z \rightarrow ee$ and $Z \rightarrow \mu\mu$ data

Bit pattern

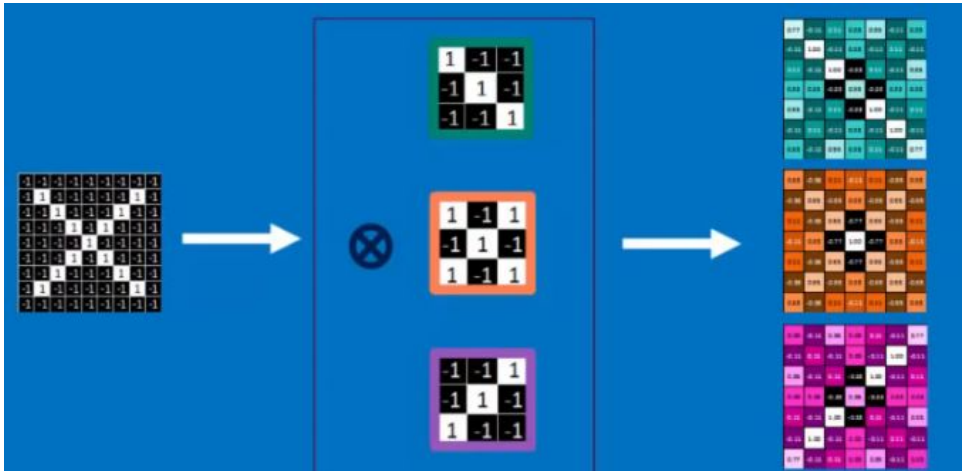

Convolutional Neural Networks

Convolution Layer

- Filtering across every possible image patch
- Doing this for multiple features: single image -> stack of filtered images

Idea

- Learn local patterns in feature input space
- Learn spatial hierarchies of patterns

Obstacles

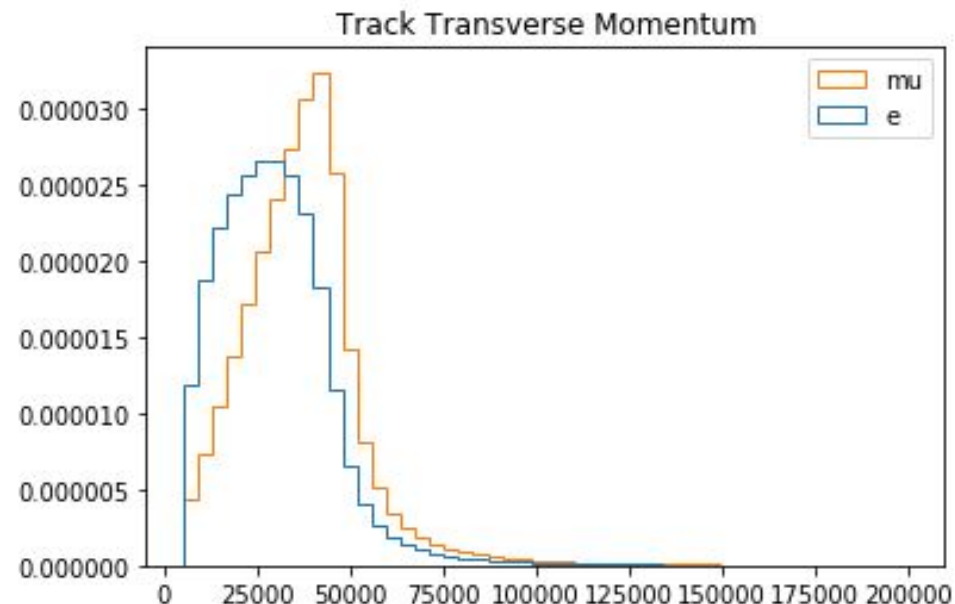

Data

- Amount
- Availability

Computationally intensive

- Can't use personal machine
- Frequent server downtime
- Long training times

Constantly learning - double edged sword!

```
Conv2D(filters=32, kernel_size=(2, 2), activation='relu', input_shape=(40,24,1))
Conv2D(filters=32, kernel_size=(2, 2), activation='relu')
MaxPool2D(pool_size=(2,2), strides=(2,2))

Conv2D(filters=64, kernel_size=(2, 2), activation='relu')
Conv2D(filters=64, kernel_size=(2, 2), activation='relu')
MaxPool2D(pool_size=(2,2), strides=(2,2))

flatten()

Dense(units=120, activation='relu')
Dense(units=84, activation='relu')
Dense(units=1, activation='sigmoid')

model.compile(loss='mse', optimizer='adam')

callbacks = [
    keras.callbacks.EarlyStopping(monitor='loss', patience=2, restore_best_weights=False),
    keras.callbacks.EarlyStopping(monitor='val_loss', patience=1, restore_best_weights=False)]

x_train, y_train, validation_data = (x_val, y_val), batch_size = 1028, callbacks = callback_log, epochs = 10)
```

Kernel Restarting

The kernel for TRT_pid/from server/scalar+bps.ipynb appears to have died. It will restart automatically.

OK

Current Performance and Future Work

Outperforming current PID tool

- Currently achieving .86 AUC
 - 20% increase over current tool!

Will continue this fall

- Making model shift-invariant for timing corrections
- Explore autoencoders
- Experiment with ensembling methods

Great potential for use in an all-Argon TRT gas geometry in Run III

- Continue to work with and report to the TRT software group to continue its development
