3D Crystal Calorimeter for CEPC: R&D status

Yong Liu (Institute of High Energy Physics, CAS), on behalf of the CEPC Calorimetry Working Group

The 4th FCC Physics and Experiments Workshop Nov. 10-13, 2020

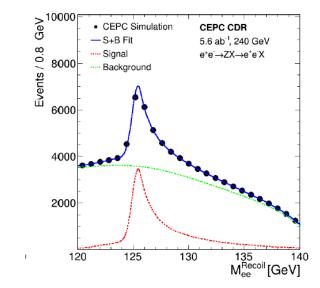

Yong Liu (liuyong@ihep.ac.cn)

https://indico.cern.ch/event/932973/

Motivations

- Background: future lepton colliders (e.g. CEPC)
 - Precision measurements with Higgs and Z/W
- Why crystal calorimeter?
 - Homogeneous structure
 - Optimal intrinsic energy resolution: $\sim 3\%/\sqrt{E} \oplus \sim 1\%$
 - Energy recovery of electrons: to improve Higgs recoil mass
 - Corrections to the Bremsstrahlung of electrons
 - Capability to trigger single photons
 - Rich flavour physics at Z-pole, potentials in search of new physics, ...
- Fine segmentation
 - PFA capability for precision measurements of jets

3D crystal ECAL: past workshops

- Ideas firstly proposed: <u>CEPC calorimetry workshop (March 2019)</u>
- Follow-up workshop: Mini-workshop on a detector concept with a crystal ECAL
 - R&D efforts targeting key issues and technical challenges

Virtual mini-workshop on a detector concept with a crystal ECAL, July 22-23, 2020, <u>https://indico.ihep.ac.cn/event/11938/</u>

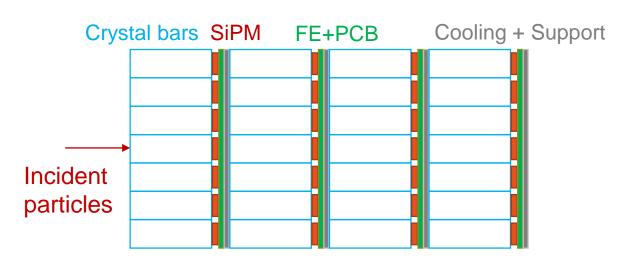

R&D efforts targeting key issues and technical challenges

- Key issues: performance studies and optimization
 - Segmentation: in longitudinal and lateral directions
 - Performance: single particles and jets with PFA -> separation, energy splitting
 - Impacts from dead materials: upstream tracker, services (cabling, cooling)
 - Fine timing: e.g. for positioning
 - Dual-gated or dual-readout techniques (to improve hadronic energy resolution)
- Critical technical questions/challenges
 - Detector unit: crystal options (BGO, PWO, etc.), SiPMs (HPK, NDL, etc.)
 - Front-end electronics: cornerstone for instrumentation of high-granularity calorimetry
 - Multi-channel ASIC: high signal-noise ratio, wide dynamic range, continuous working mode, minimal dead time, etc.
 - Cooling and supporting mechanics design
 - Calibration schemes and monitoring systems: SiPMs, crystals and ASICs
 - System integration: scalable detector design (modules), mass assembly, QA/QC

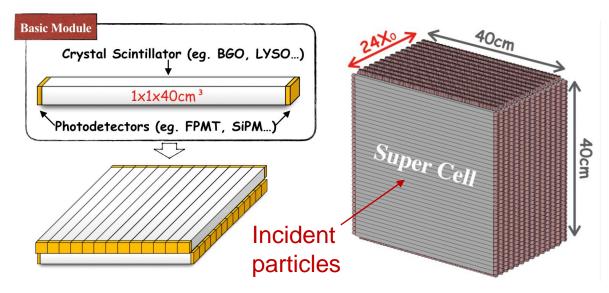

3D crystal ECAL: 2 major designs

Design 1

- Longitudinal segmentation
- Fine transverse segmentation
- Single-ended readout with SiPM
- PFA-oriented design
- High channel-count, impact from services

Design 2

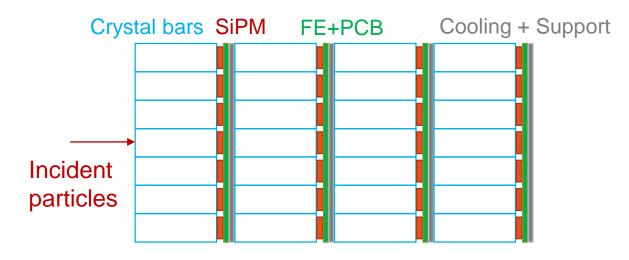

- Long bars: 1×40cm, double-sided readout
 - Super cell: 40×40cm cube
- Crossed arrangement in adjacent layers
- Significant reduction of #channels
- Timing at two sides: positioning along bar

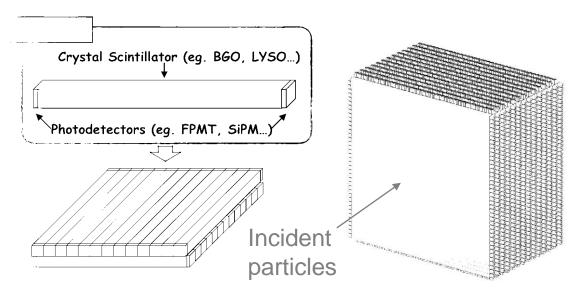

3D crystal ECAL: 2 major designs

Design 1

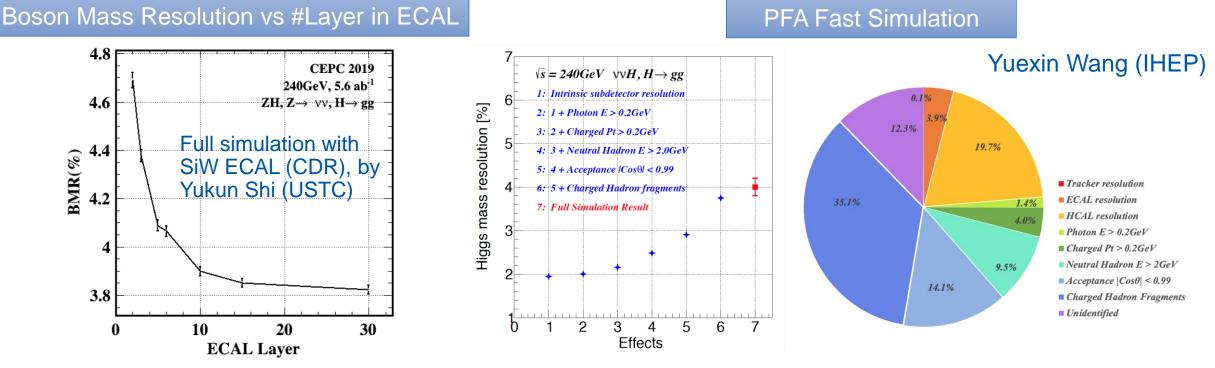

- Design optimisations
 - Transverse: separation power
 - Longitudinal: impact from dead material, leakage correction (backup)
- Neutral pion reconstruction (working)

- Multiplicity of incident particles (jets)
 - Based on physics benchmarks (backup)
- Digitisation in each long bar: done
- Reconstruction algorithm under development
- Event display and (pattern) reconstruction

Longitudinal segmentation optimisation

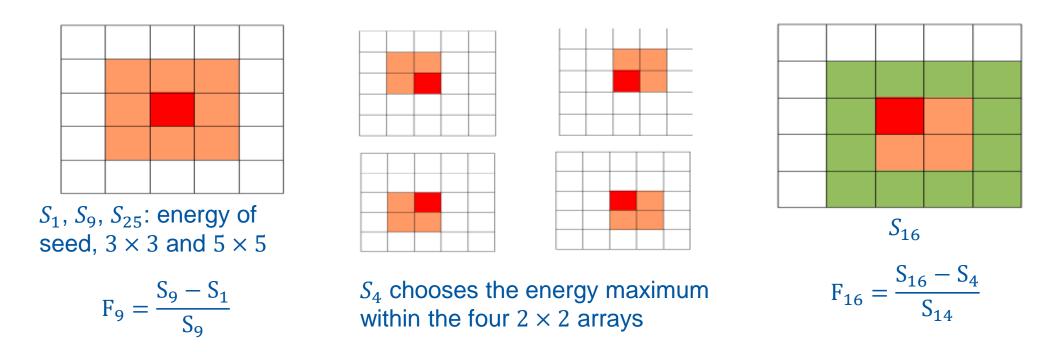

- Full simulation with SiW-ECAL via the benchmark Higgs to 2 gluons
 - 10 longitudinal layers or more in ECAL can help achieve better than 4% of BMR
 - Expect small impact from ECAL intrinsic energy resolution (PFA fast simulation)
- Guidance for the longitudinal segmentation
 - Will perform more benchmark studies for crystal ECAL in the CEPC detector simulation

Crystal transverse size optimisation

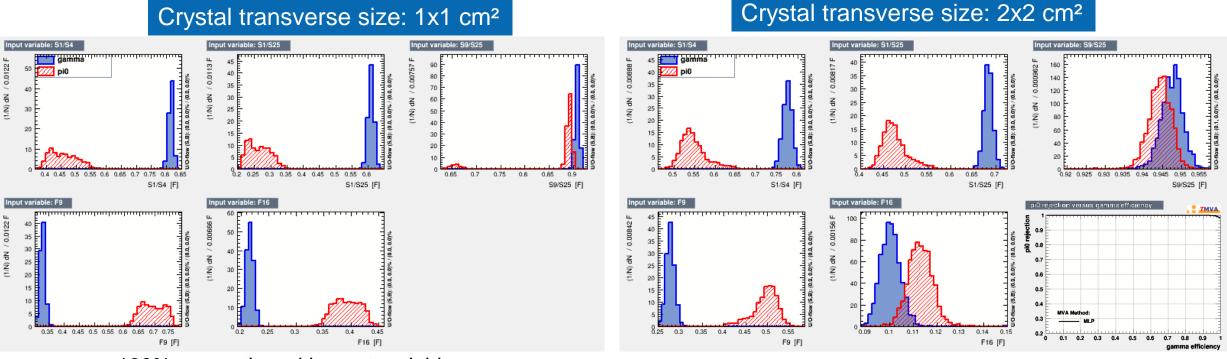

- Study of the separation performance of γ and merged π^0
 - Can not be distinguished in transverse shower profiles
- Energy-related variables defined for TMVA
 - S1/S4, S1/S9, S1/S25, S9/S25, S4/S9, F9, F16

Crystal transverse size optimisation

- Separation performance of the 40GeV γ and merged π^0

100% separation with most variables

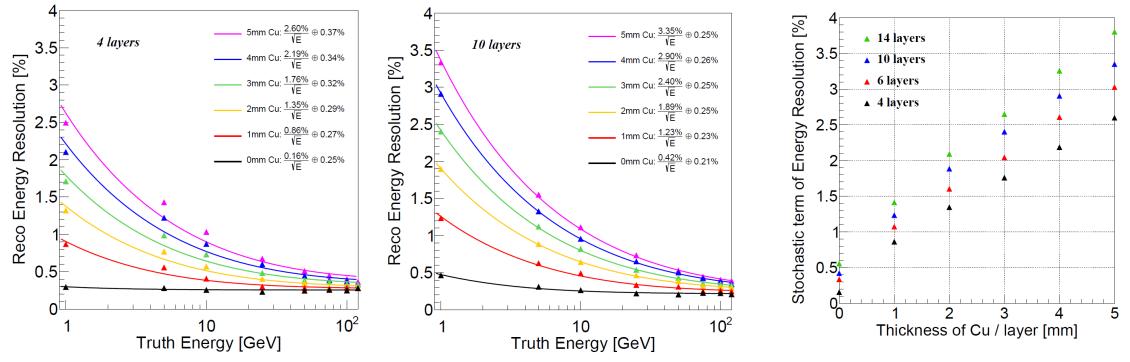

100% separation with variables like S1/S4, S1/S25 and F9

Preliminary studies show that 2x2 cm² transverse size can well separate γ/π^0 up to 40 GeV. Next: what would be the performance of π^0 reconstruction (with different transverse sizes)?

Longitudinal segmentation: impact from services

- Energy resolution with different numbers of sampling layers
 - 24X0 total depth for crystals: fixed in all scenarios
 - Used copper to model the inter-layer services (e.g. cooling)
 - Light materials will be considered for realistic cooling designs: Al, carbon-fibre...

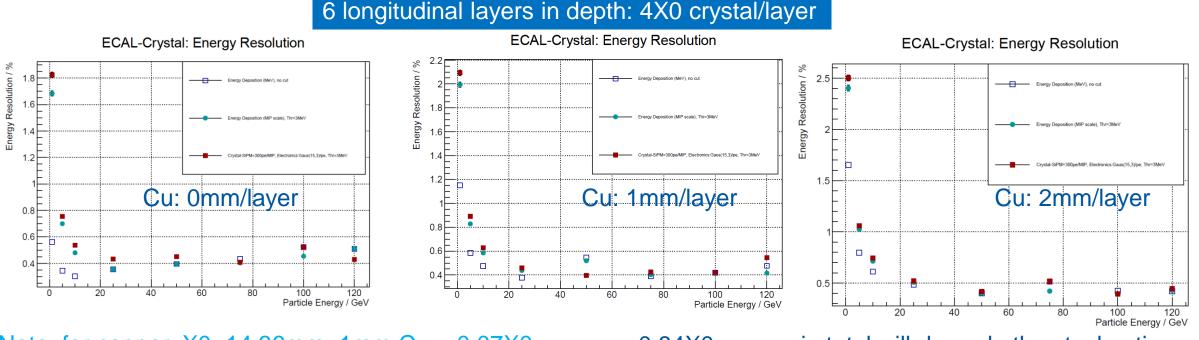

Note: energy fluctuations and leakages dominate; impacts of digitization in the next page

Longitudinal segmentation: with digitisation

- Digitisation tool
 - Photon statistics (crystal and SiPM): reasonably high light yield
 - Electronics resolution for single photons: taken from the existing ASIC

Note: for copper, X0=14.36mm, 1mm Cu = 0.07X0; for Aluminum, 0.07X0 = 6.2mm (X0=88.97mm) 0.84X0 copper in total will degrade the stochastic term to ~2.5%

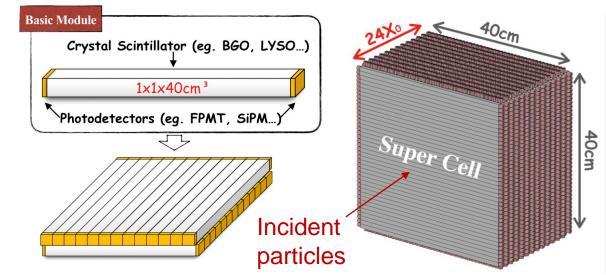

High-granularity crystal ECAL: 2 major designs

Design 1: short bars

Crystal bars SiPM FE+PCB Cooling + Support

- Design optimisations
- Transverse: separation power
- Longitudinal: impact from dead material, leakage correction (backup)
- Neutral pion reconstruction (working)

Design 2: long bars (current focus)

Advantages

- Longitudinal granularity: 24 layers, 1X0/layer
- Save #channels, ~15 times less
- De facto 3D calorimeter: timing for hit positions for transverse granularity

Key issues

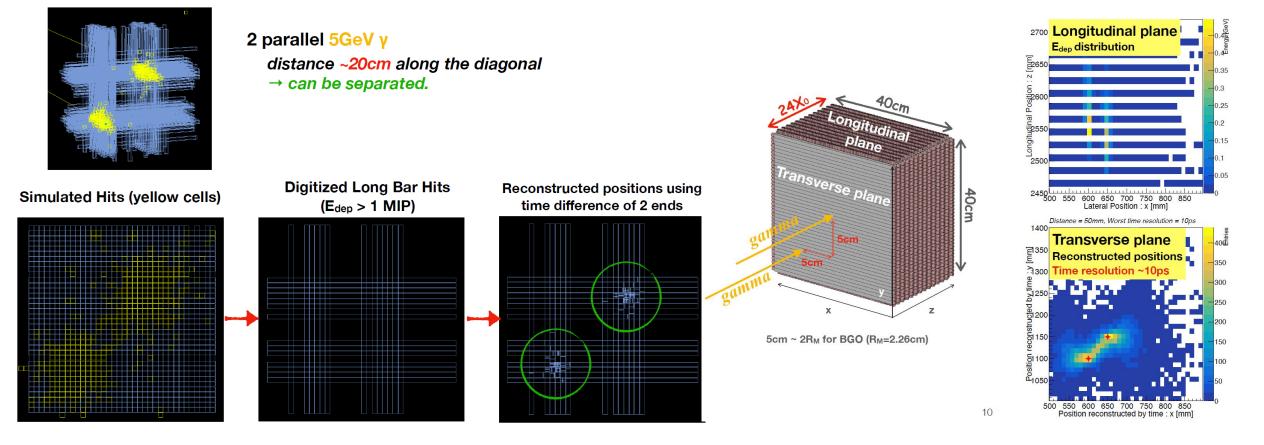

- Ambiguity: multiple incident particles within one super cell
- Separation of nearby showers
- Impact on the Jet Energy Resolution (JER)

cReconstruction with 2 incident particles

Patterns in event display: 2 photons

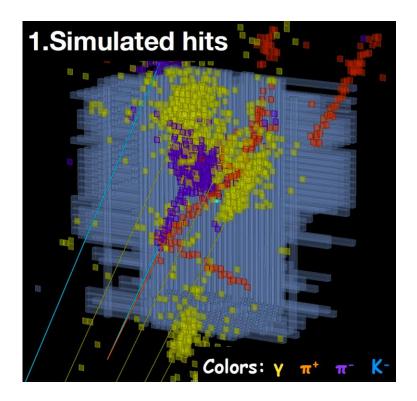

Shower profiles: 2 photons

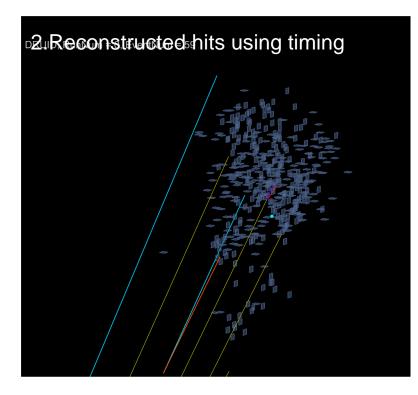

Patterns with jets in Event Display

- Patterns for first impression, but still complex...
- Need further studies on positioning and energy splitting

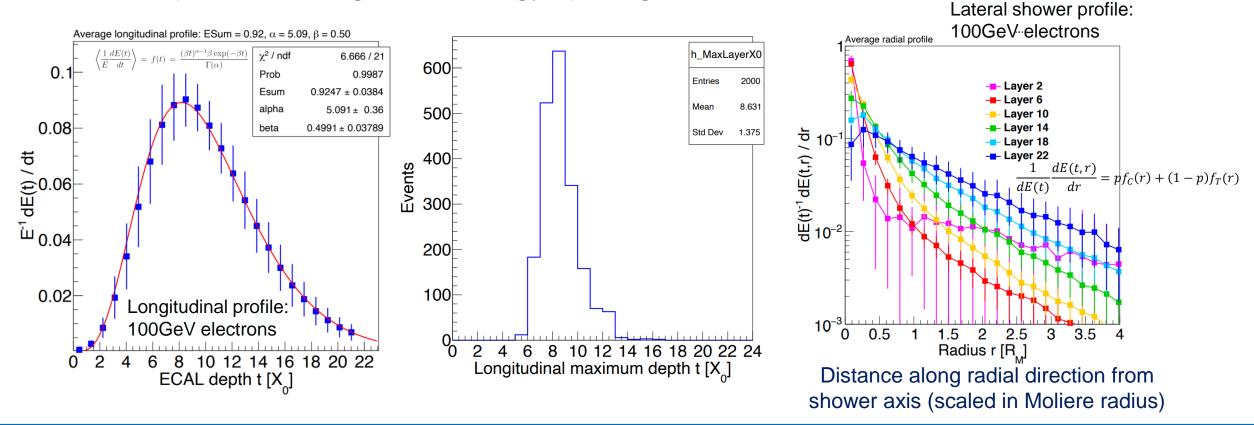

Reconstructed hits with energy information

4[™]Reconstructed hits with energy > 4MłPs

5

Shower profiles studies in simulation

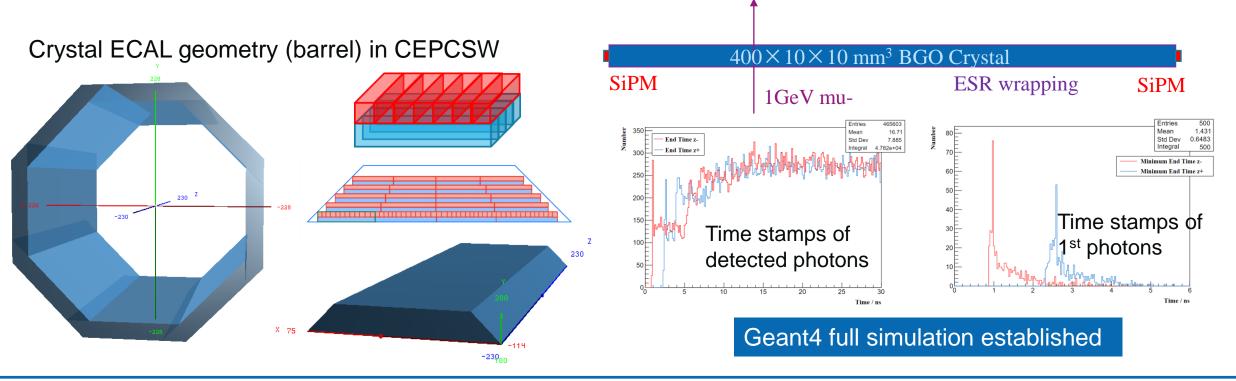

- How can we separate two close-by EM showers?
- EM shower profiles in 3D with highly granular cells: ongoing studies
 - Input to the weights for energy splitting

Latest progress in the new CEPC software

- Crystal calorimeter in <u>CEPCSW</u> (common framework)
 - Geometry of long crystal bars: implementation in DD4HEP (done)
 - Digitisation: based on the Geant4 full simulation of a single crystal bar (done)
 - Reconstruction with single particles and two close-by showers: ongoing

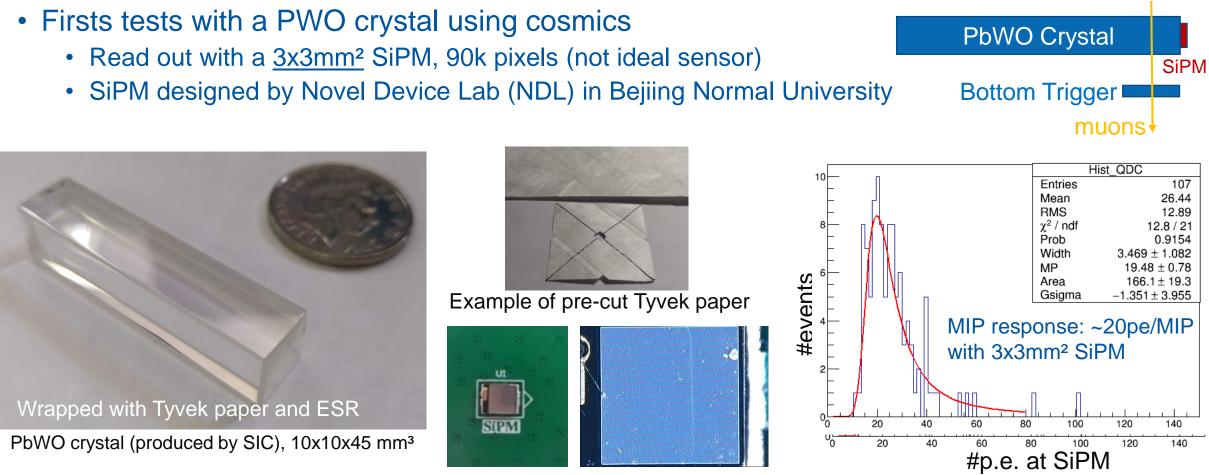

Critical questions for 3D crystal ECAL: technical part

- Detector unit: crystal options (BGO, PWO, etc.), SiPMs (HPK, NDL, etc.)
- Front-end electronics
 - Cornerstone for successful instrumentation of high-granularity calorimetry: e.g. CALICE prototypes, CMS HGCAL project
 - Multi-channel ASIC: high signal-noise ratio, wide dynamic range, continuous working mode, minimal dead time, etc.
- Cooling and supporting mechanics design
 - Power consumption (solid inputs from electronics)
 - Impacts of cooling structure to performance
- Calibration schemes and monitoring systems
 - For SiPMs, crystals and ASICs in the long term
- System integration: scalable detector design (modules), mass assembly, QA/QC

Studies with PWO crystal bar and NDL-SiPM

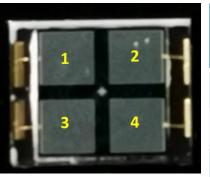

NDL-SiPM 3x3mm² with 10um pixels

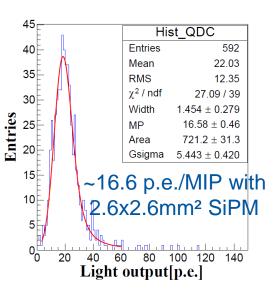

Note: a larger SiPM (e.g. 6x6mm² or larger) can be used for better light collection efficiency

First studies on new-generation of NDL-SiPM

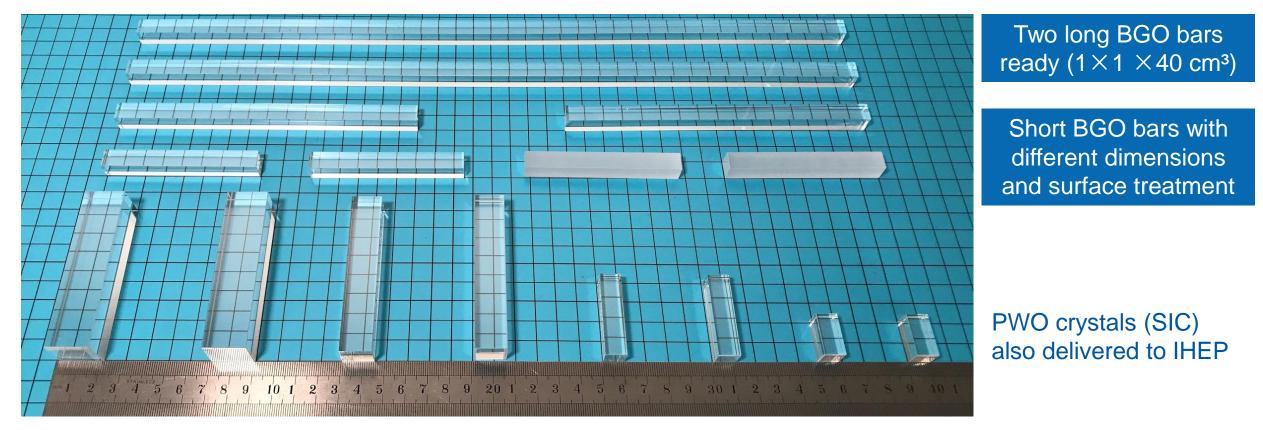

- Tests made for a NDL-SiPM prototype of the latest generation
 - Many improvements: lower dark-count noise, higher PDE,...
- Foresee further tests with new NDL-SiPMs (better candidates for crystal readout)
 - High density: 3×3 mm², 6µm, 245k pixels, PDE~30% (e.g. for BGO)
 - Large area: 6×6 mm², 15µm, 170k pixels, PDE~40% (e.g. for PWO), <u>under test</u>

11-3030C-S

Crystal studies: near-future plans

- BGO and PWO crystal samples: varying dimensions, surface treatment
 - With a major focus on timing performance: e.g. Cherenkov photons

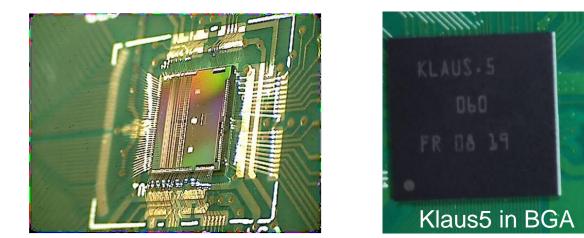

BGO crystal samples already delivered to IHEP (photo by courtesy of Junfeng Chen, SIC-CAS)

Front-end electronics for SiPM readout

- ASIC "KLauS": developed within the CALICE collaboration
 - Designed by U. Heidelberg (KIP), originally for CALICE AHCAL (scintillator-SiPM)
 - Promising candidate: 36-channel, low-power
 - Excellent S/N ratio: stringently required by high-dynamic SiPMs (small pixels)
 - Continuous working mode: crucial for circular colliders (no power pulsing)
 - Need to quantitatively verify its performance and power consumption

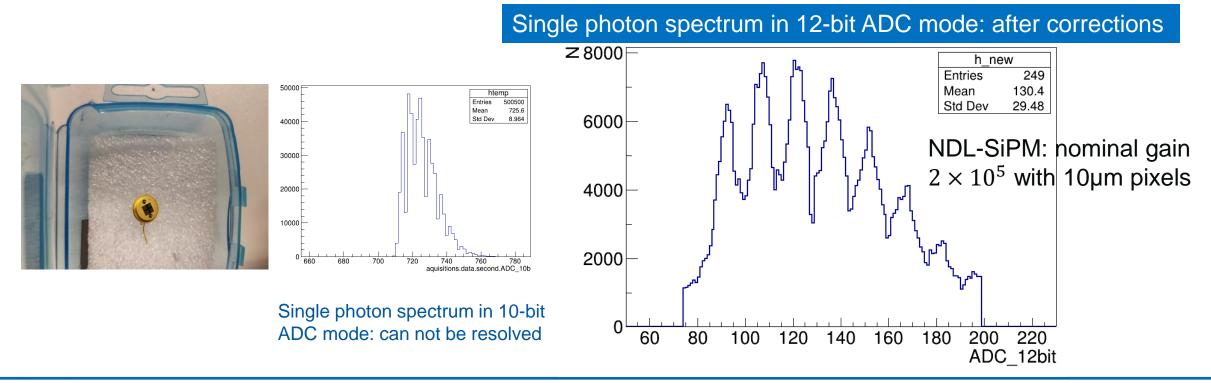

Wire-bonded Klaus5 chip

Klaus5 tests with NDL-SiPM

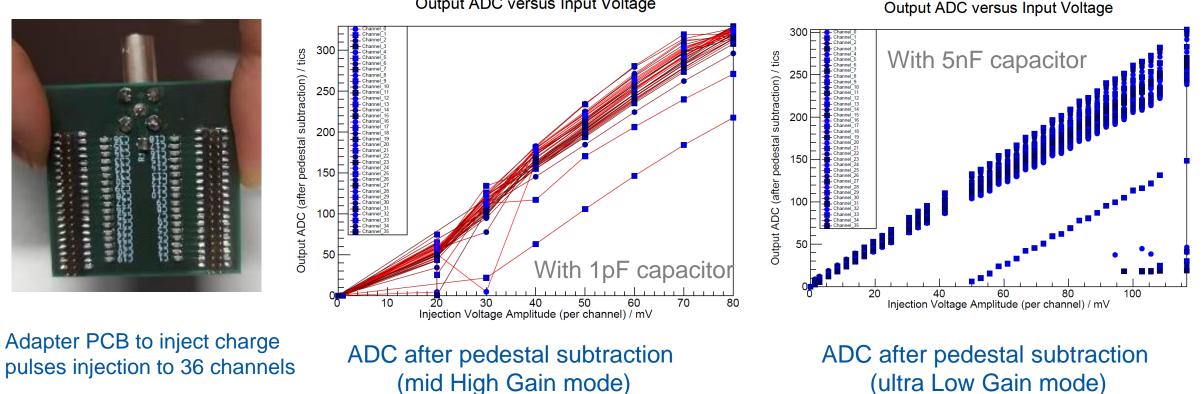

- NDL-SiPM features: small pixel pitch (10µm or smaller), high PDE
 - Requires high S/N ratio in electronics to resolve single photons (small gain)
- Klaus5 proved to be able to resolve the single photons (32fC/p.e.)
 - Benefits from its high S/N ratio and high resolution

Klaus5 dynamic range: charge injection

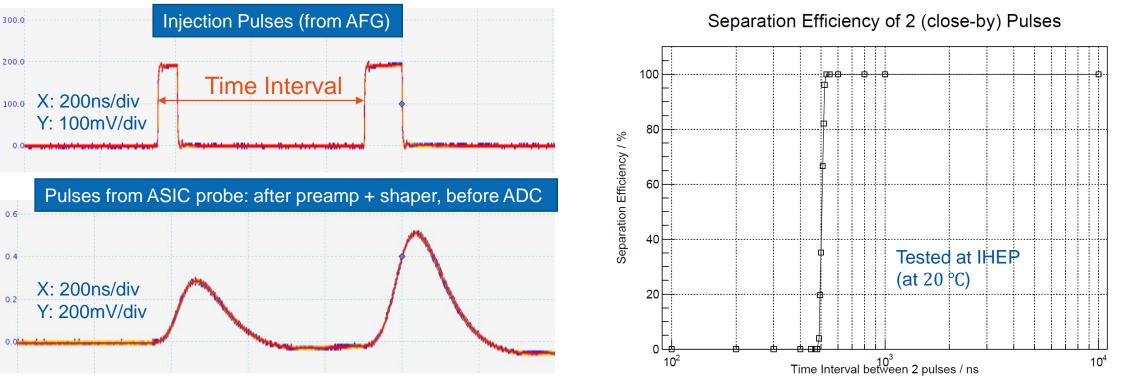

- Testing of all 36 channels
 - Different working modes (high gain and low gain)
 - Dynamic range: ~550pC as the maximum charge (preliminary results)

Output ADC versus Input Voltage

Klaus5 dead time measurements

- Varying time interval between 2 injection pulses: 100ns 10µs
- When time interval > 500ns, 100% efficiency of separating the two pulses
 - Promising feature for 100% duty cycle at circular colliders
 - To be noted: tests were made for a single channel
 - 36 channels: bottleneck of data transmission speed in DAQ (RaspberryPI-based)

Similar results at arXiv:2005.08745

Summary

- 3D crystal ECAL: high granularity
 - Aim to achieve optimal energy resolution and PFA capability
 - Key issues for optimization and technical challenges (partially) identified
 - Further studies, discussions and iterations
 - Steady R&D progress
 - Optimisation studies: longitudinal/transverse segmentation, depth
 - Simulation studies on the detector layout with long bars
 - Technical developments:
 - SiPMs and crystals
 - Characterisations of SiPM-dedicated low-power readout ASIC (KLauS)
 - Dynamic range: TOT technique (in backup)
- Welcome broader collaborations: synergies with FCC-ee
 - Early R&D stage, many open questions/issues
 - In the common software framework (Gaudi, Key4HEP, DD4HEP, ...)

High-Granularity Crystal Calorimetry Letter of Intent – Snowmass 2021

August 31, 2020

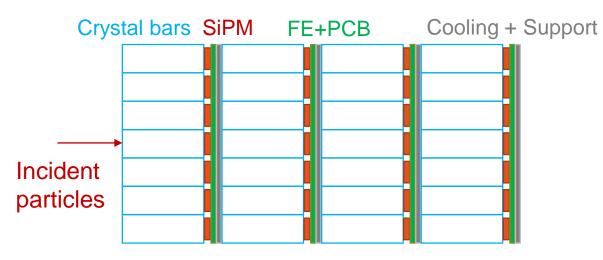

High-Granularity Crystal Calorimetry Letter of Intent

Future lepton colliders provide a unique opportunity to probe the Standard Model and potentially uncover new physics beyond the Standard Model with Higgs, *W*, and *Z* bosons richly produced in the exceptionally clean environment. The recently released European Strategy Updates on the Particle Physics [1] elaborates this consensus that an electron-positron Higgs factory is the highest-priority next collider, including implementations such as the Circular Electron Positron Collider (CEPC) [2, 3], the Future Circular Collider (FCC-ee) [4], and International Linear Collider [5]. The precision physic programs set a stringent requirement on the jet energy resolution to separate and measure hadrons and jets. Detectors based on the Particle-Flow Approach (PFA) [6] provide an essential and feasible option to meet this goal and achieve an unprecedented jet energy resolution of around $30\%/\sqrt{E(GeV)}$, which further requires calorimetry to be finely segmented in 3 dimensions. Within the CALICE Collaboration [7], as proof-of-principles, various high-granularity calorimetry options have been extensively studied with prototyping and beam tests.

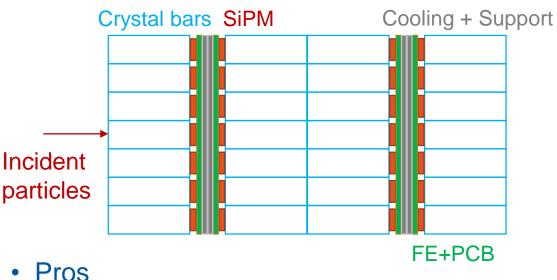

Considerations on detector layouts

Layout 1: same module for each layer

- Pros
 - Modular design
 - Uniform structure (easy calibration)
- Cons
 - Material budgets (cooling, mechanics)

Layout 2: every two layers share the same cooling service and mechanics

- Save material budget (e.g. a factor of two)
- Cons
 - Non-uniform sampling structure: will need specific considerations for calibration

Studies on physics requirements

- Estimate the multiplicity level of jets: fast simulation
 - Mean ~4 particles within the hottest tower

Multi-jet events at generator level:

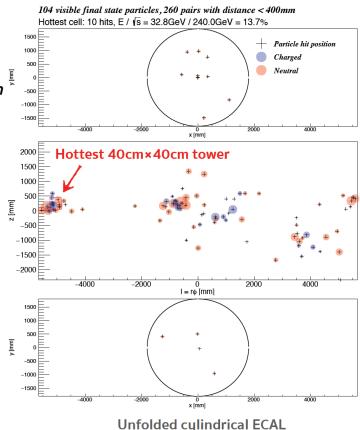

- Calculate the impact point of visible final states on the inner surface of ECAL
- See 240GeV, ZH (Z→qq, H→gg) (4-jet event) as an example

Parameters in calculation:

- A simple cylinder ECAL
- Inner Radius, R=1800mm
- Barrel Length, L=4700mm
- Magnetic Field, B=3T

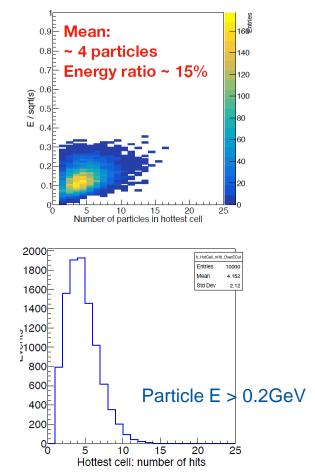

Analysis level:

- Hottest tower (with maximum energy)
 - multiplicity and energy ratio to \sqrt{s}
- Average proportion of towers with multiparticle

Yuexin Wang (IHEP)

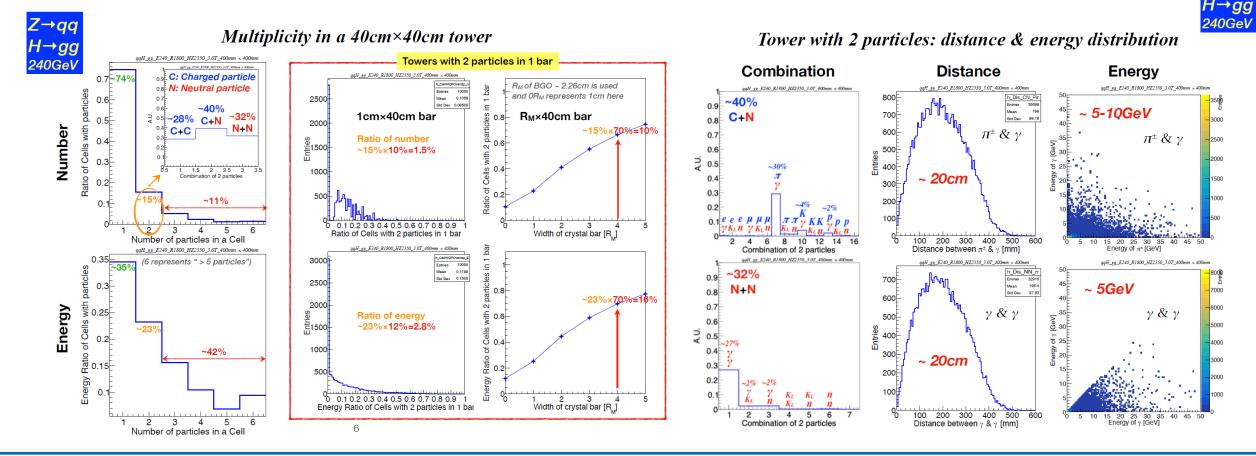

Hottest 40cm × 40cm tower

Studies on physics requirements

- Estimate the multiplicity level of jets: fast simulation
 - Detailed studies with 2 incident particles (from a jet) hitting the hottest tower

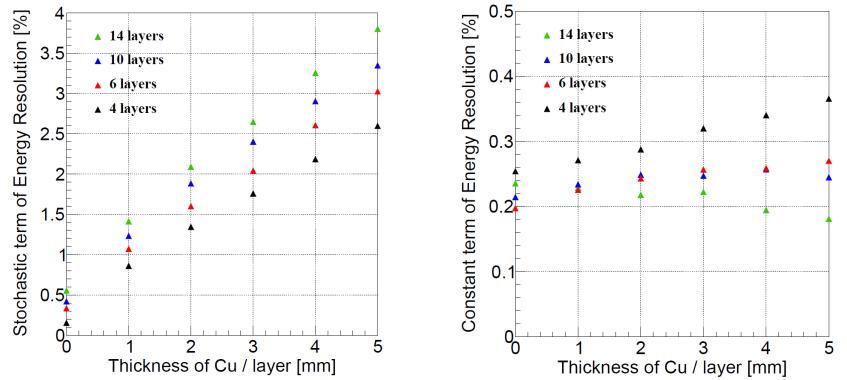

→aa

Yuexin Wang (IHEP)

Longitudinal segmentation: impact from services

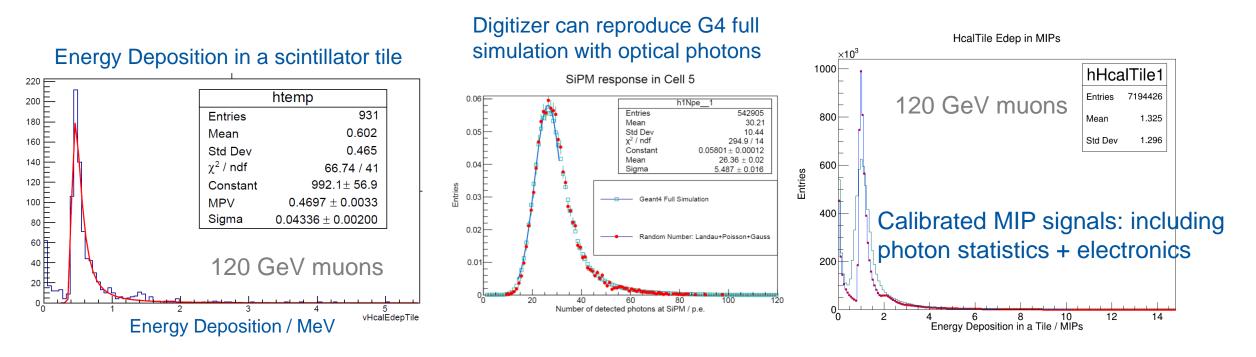

- Stochastic and constant terms (extracted from the previous page)
 - Varying thickness of dead materials between layers (services as cooling, cabling, etc.)
 - Effects digitisation in the next page (photon statistics and electronics resolution)

Note: digitization not implemented yet; so energy fluctuations (and leakages) dominate

Digitizer in simulation

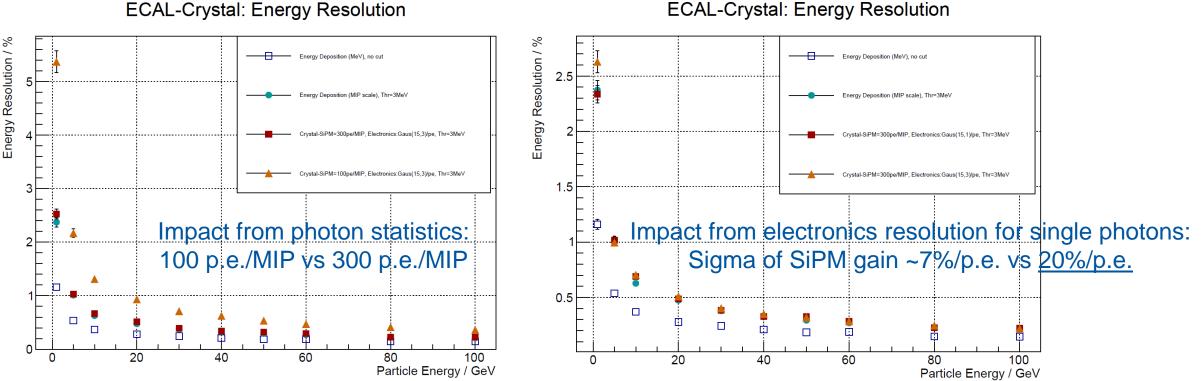

- Geant4 hit (energy deposition) \rightarrow ADC signal in electronics (charge)
- Realistic factors that influence energy resolution
 - Photon statistics: #p.e./MIP, guided by Geant4 full simulation (optical photons)
 - Electronics resolution for single photons: #ADCs/p.e.

Digitizer in simulation for crystal ECAL

MC samples: electrons

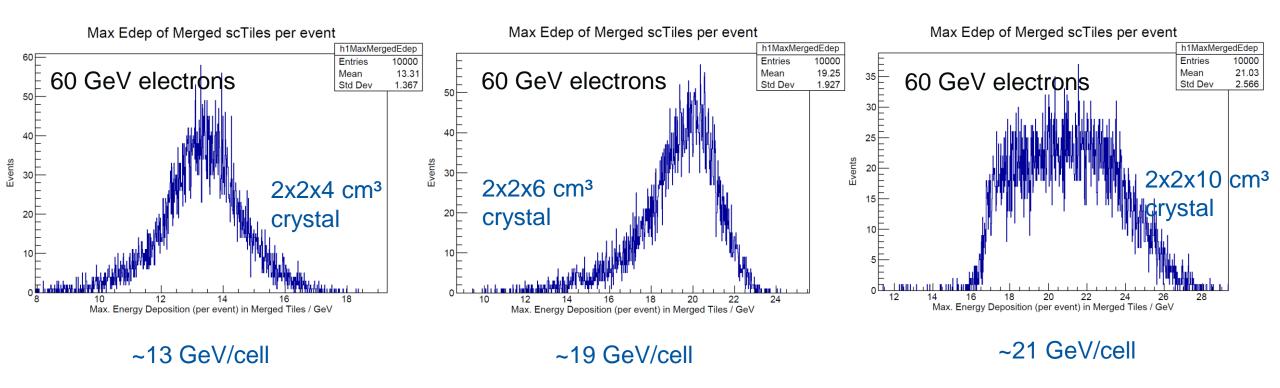

ECAL-Crystal: Energy Resolution

- Quantitative studies for the impacts of photostatistics and electronics
 - Stochastic terms: ~5% for lower light yield (e.g. PWO), ~2% for higher light yield (e.g. BGO)
 - Negligible impact from single photon resolution at energy regions > 5GeV

Dynamic range: simulation with high-energy electrons

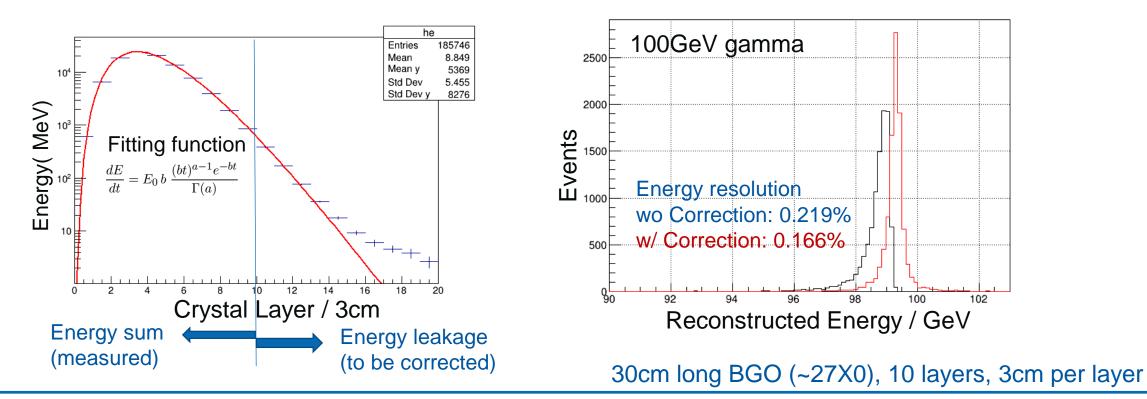

- Maximum energy deposition per cell
 - Depends on the crystal segmentation configurations
 - Provide inputs for the SiPM and its readout electronics

Crystal granularity optimisations

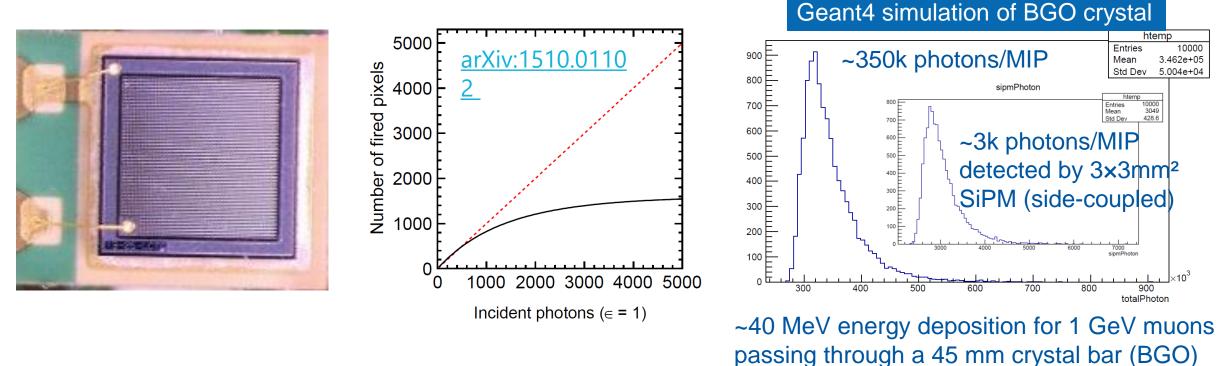

- Longitudinal depth
 - Use shower profiles in segmented layers to correct for tails (energy leakage)
 - Aim for shorter crystal depth (cost), balance with performance (correction precision)

Crystal cells: dynamic range

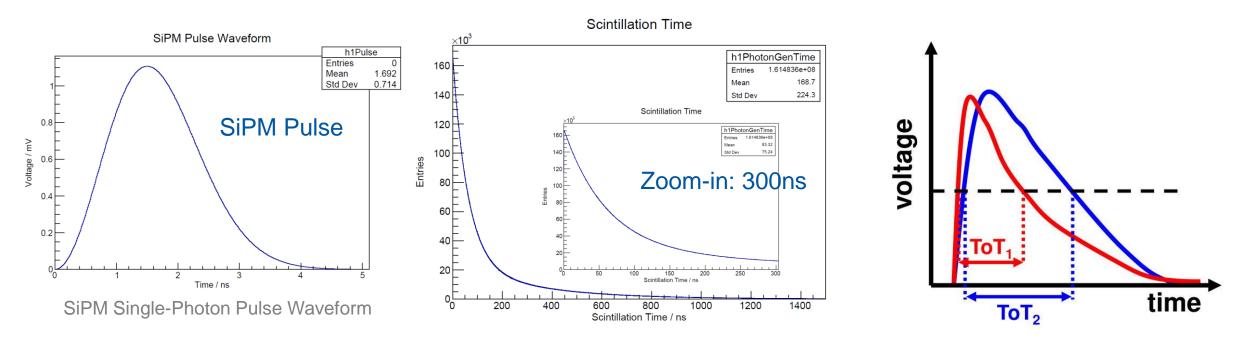

- Silicon Photomultiplier (SiPM)
 - Non-linear response due to finite #pixels (each as a binary counter)
- Crystal such as BGO produces (too) many photons
 - Stringent requirement on the readout: response linearity

Crystal cells: dynamic range

- Geant4 full simulation of TOT with BGO crystals
 - Realistic simulation of BGO scintillation: detailed properties
 - 8200 photons/MeV, time constants tau1=60ns, tau2=300ns
 - TOT: time duration of the rising and trailing edges at a fixed threshold

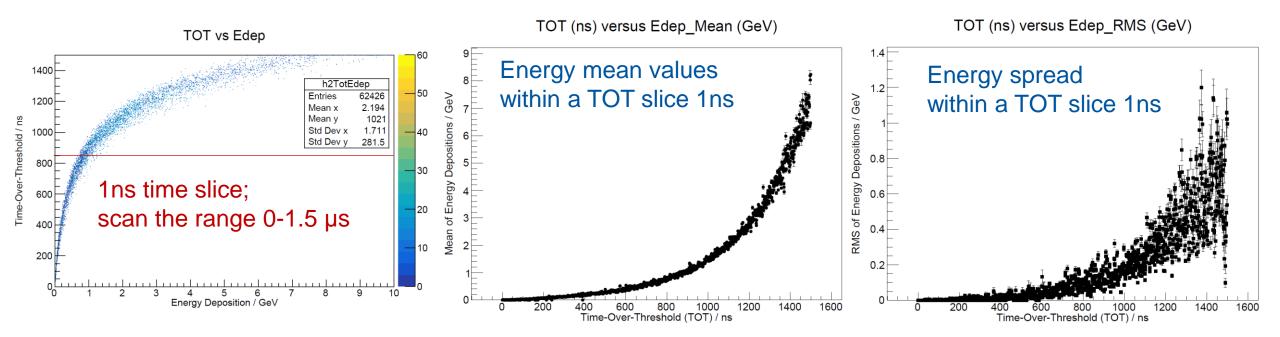

Computing intensive for the simulation (>1M photons); techniques developed to fasten the procedure

Dynamic range: TOT simulations

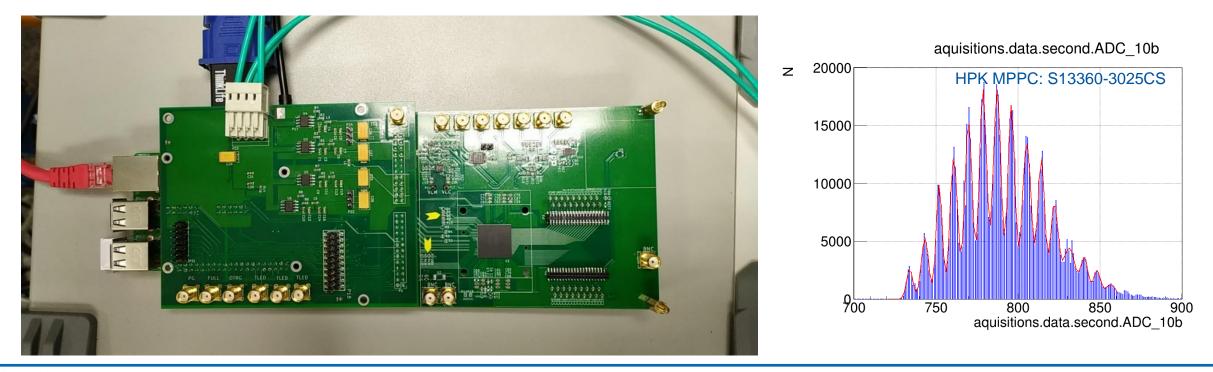

- Energy depositions in a crystal cell: 10MeV 8 GeV
 - TOT values will go beyond 1.5 µs for energy deposition larger than 8 GeV
 - Energy spread: fluctuations due to BGO scintillation long slow slope
 - Future studies: impact from TOT threshold, design with multiple thresholds

Front-end electronics for SiPM readout

- Test boards for KLauS-5 in BGA
 - Boards produced after several iterations of designs/debugging
 - Boards tested first at Heidelberg and later at IHEP
 - Synergies with the JUNO-TAO team

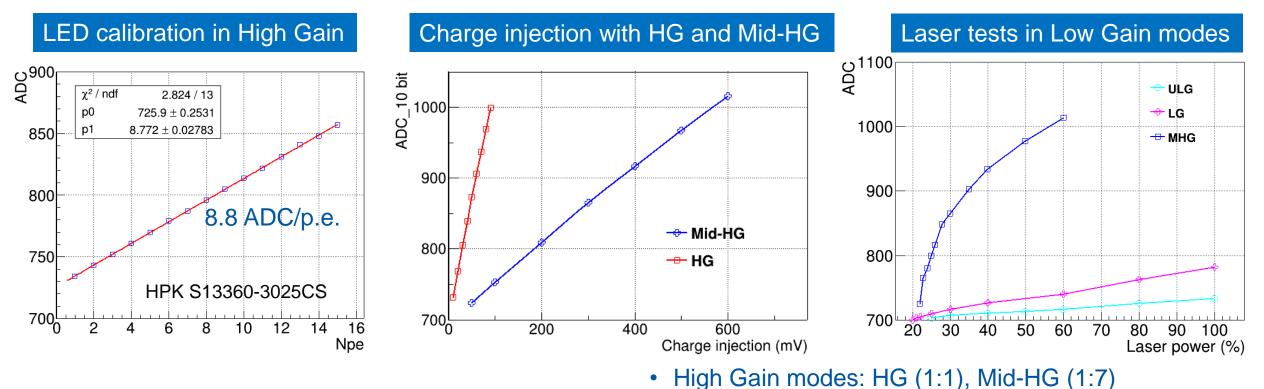

U. Heidelberg, IHEP

Klaus5: first tests with SiPM and light sources

- LED for SiPM gain calibration: done for various SiPMs
- Laser for the first test of dynamic range: qualitative results

- Low Gain modes: LG (1:40), Ultra-LG (1:100)

Crystal options

	BGO	PbWO ₄
Density (g/cm ³)	7.13	8.3
Radiation Length X ₀ (cm)	1.12	0.89
Moliere Radius RM (cm)	2.259	1.959-2.19
Minimum ionization (MeV/cm)	8.918	10.2
Refractive Index	2.15	2.20
Decay Time (ns)	fast 60 slow 300	fast <10 slow 30
Light Yield (photons/MeV)	8000-12000	100-150

- PWO
 - Pros
 - Compact (smallest X0, cost saving), fast scintillation (timing)
 - Dynamic range suitable for the linear region of SiPM (high-density pixels)
 - Cons: low intrinsic light yield: ~100 photons/MeV
- BGO
 - Pros: high intrinsic light yield: 8k~12k photons/MeV, therefore high sensitivity to low energy particles
 - Cons
 - Less compact than PWO, larger volume for the same depth (e.g. 24X0)
 - Much slower scintillation → other techniques (e.g. TOT) considered to enlarge the dynamic range (studies placed in the backup)
