# HL-LHC impedance model – coll. retraction

- Primaries and secondaries were retracted to decrease the impedance ( $\sigma$  computed with  $\varepsilon = 2.5 \mu\text{m}\cdot\text{rad}$  - top energy) – from **E. Belli & R. Bruce** :

Collimators	Previous baseline ( $\beta^*=40\text{cm}$ )	Retracted ( $\beta^*=85/105/140 \text{ cm}$ )
TCPs (IR7)	6.7 $\sigma$	<b>8.5 <math>\sigma</math></b>
TCSs (IR7)	9.1 $\sigma$	<b>10.1 <math>\sigma</math></b>

Full settings  
in appendix

- ✓ using **HL-LHC v1.5 optics** (was 1.4 previously),
- ✓ for  $\beta^*=85\text{cm}/105\text{cm}/140\text{cm}$  (instead of 40cm),
- ✓ with or without anti-telescope (no significant change in imp.),

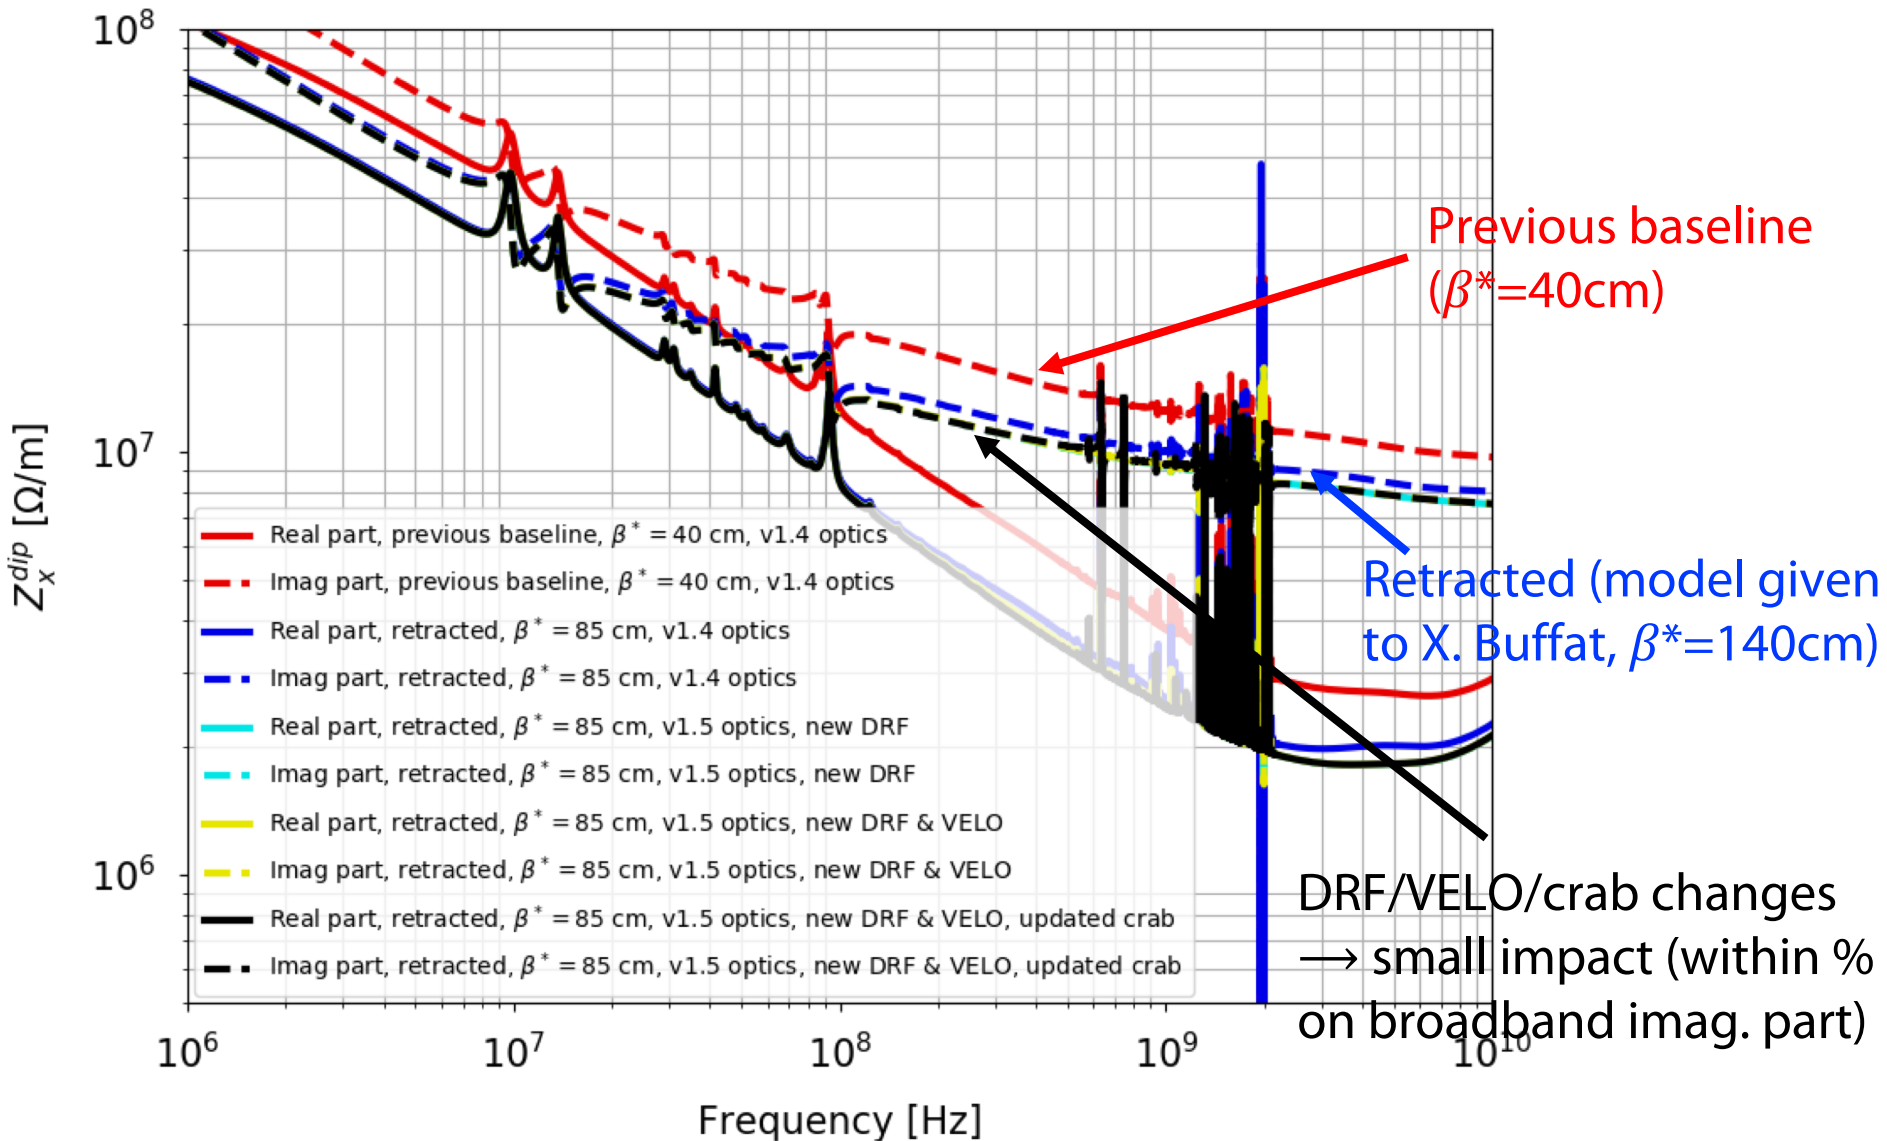

in compliance with the new **HL-LHC Proton Operation Scenario – Update** (**G. Arduini, R. Bruce, R. De Maria, R. Tomás** et al).

# HL-LHC impedance model – other updates

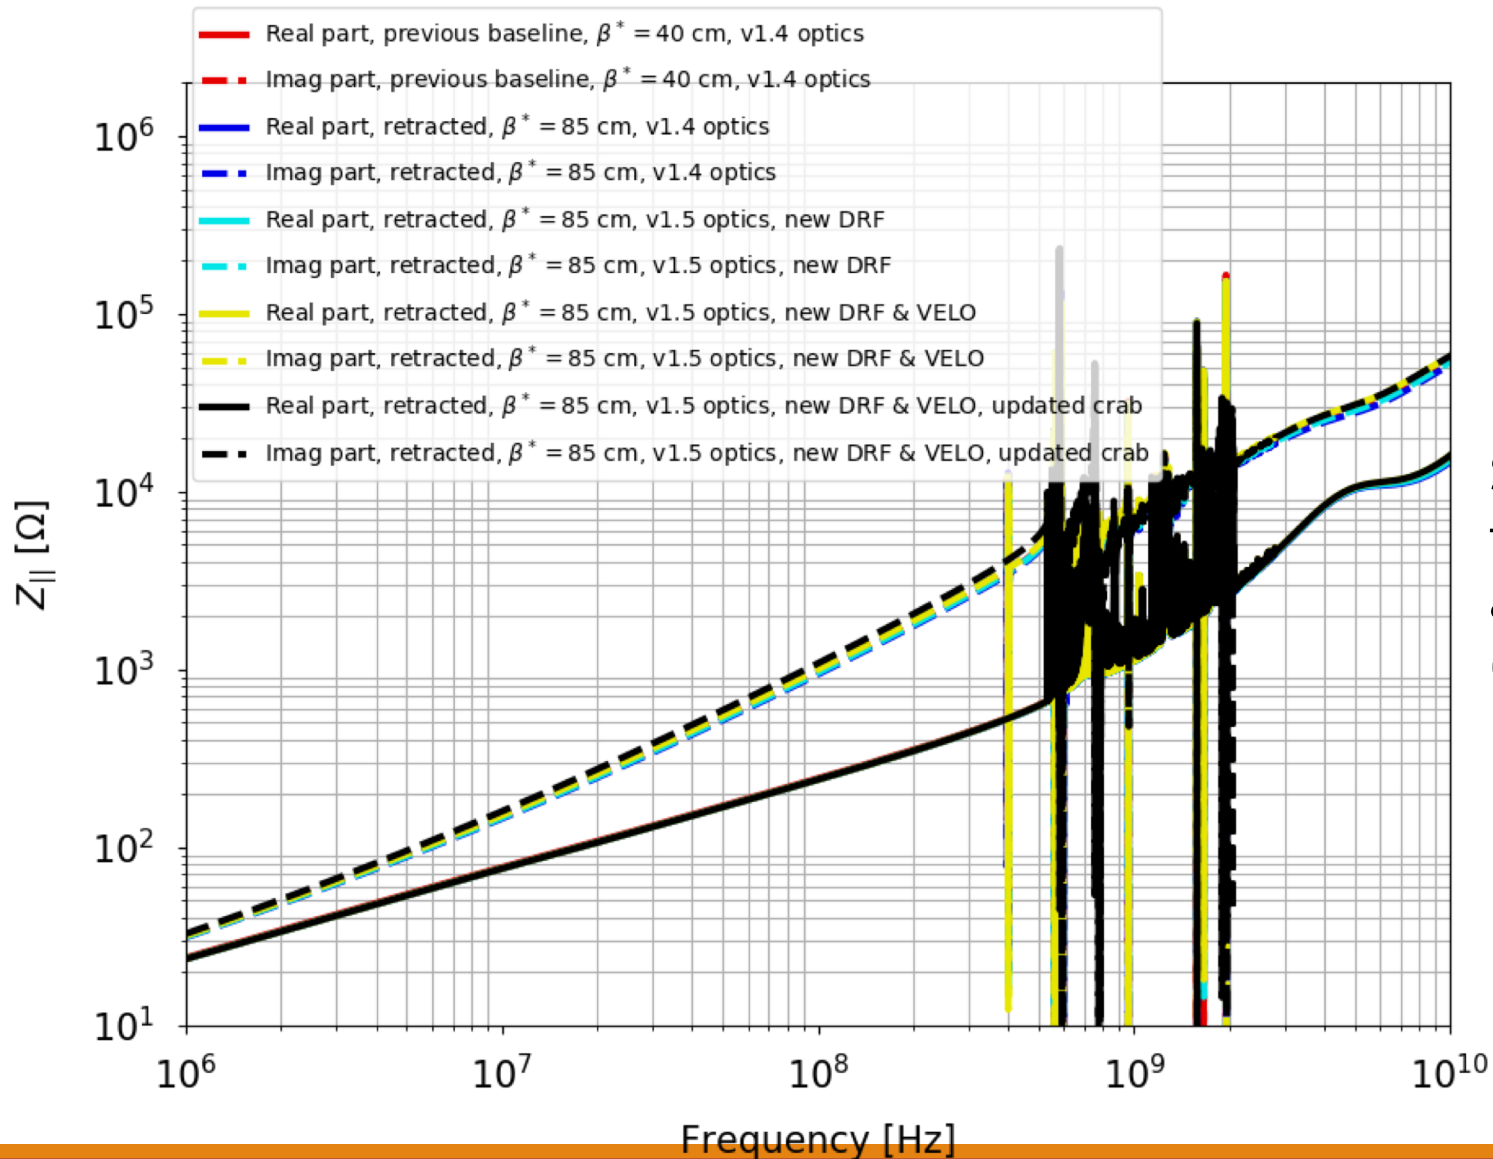

---

- **Crab cavities updated** (**J. Mitchell** et al - [RFD 18/11/2019](#) and [DQW 08/04/2019](#) – DQW to be updated again later),
- **VELO added** (**N. Biancacci** et al – [Beyond the LHCb Phase-1 Upgrade Workshop, May 2017](#)),
- **DRF** in crab cavities updated (**B. Salvant** et al – design from **C. Garion** with 4 convolutions – [WP2/WP4 meeting 26/05/2020](#)),
- See in appendix full list of elements included in model.
  
- **NOTE:** to save time, a first model was provided to Xavier **where ONLY the collimator settings were changed** (everything else kept as in previous model).

# Impact of the model updates - transverse

# Impact of the model updates - longitudinal

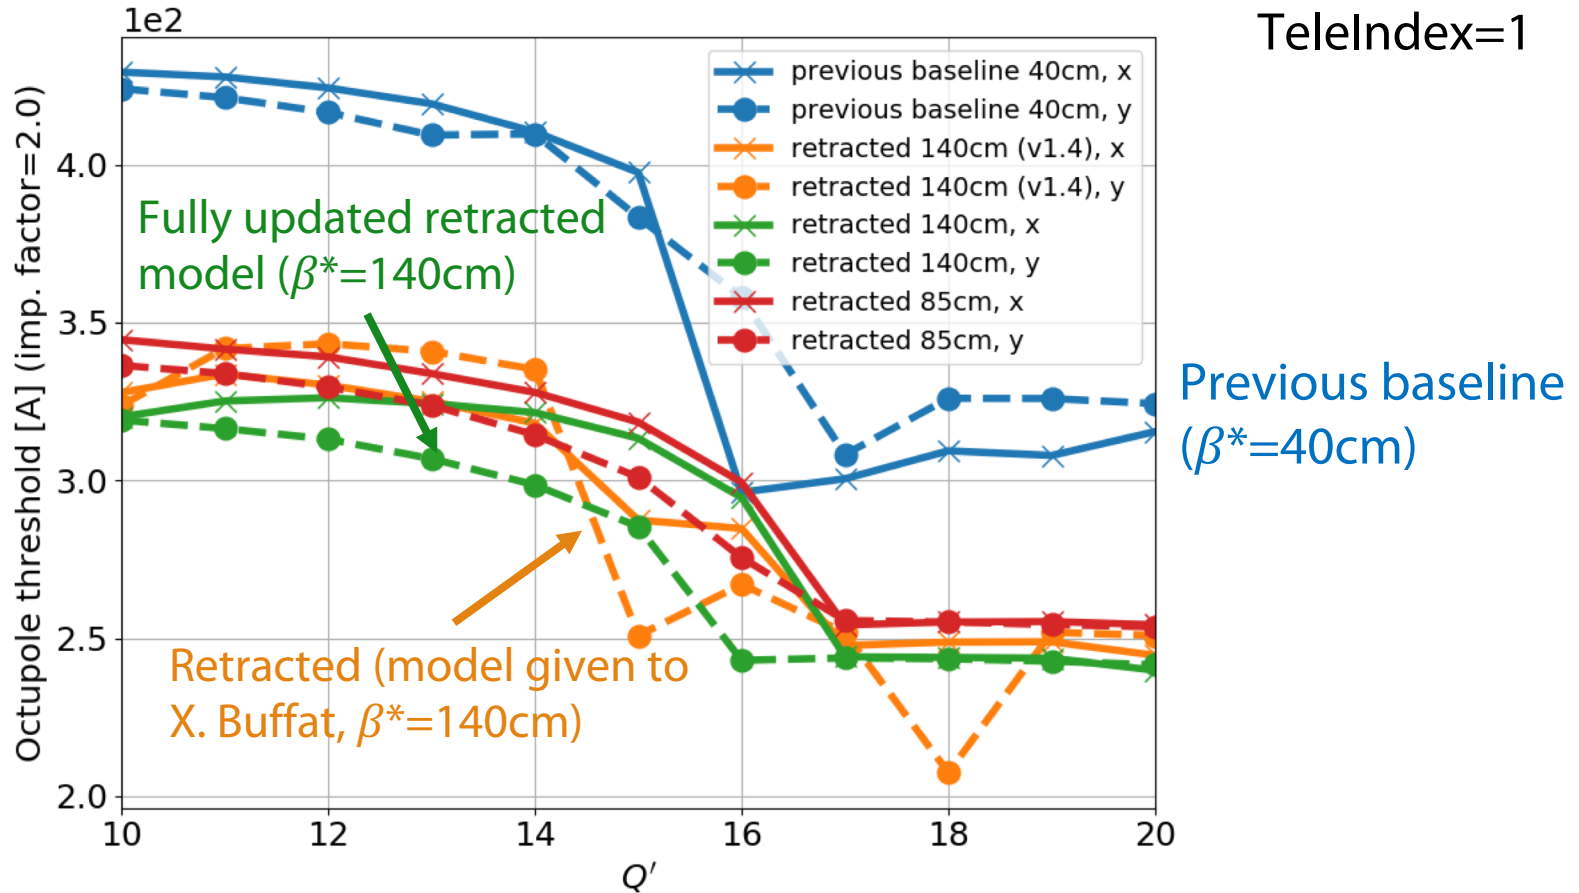

Strongest impact from VELO (+4%) and crab update (+ ~10%)

Note: fundamental mode of crab cav. is not there yet, and cutoff for broadband at 50GHz.

# Overall impact of new model on stability

B1, positive oct. polarity,  $\tau_b = 1.2$  ns,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ , damp = 0.01

- ⇒ Strong imp. reduction with collimator retraction (as expected): **-20 to 25%**
- ⇒ Rest of the update, optics &  $\beta^*$  (from 85cm to 140cm) has **small impact**.

# HOMs in crab cavities – limits on shunt imp.

- **N. Biancacci** (et al) reviewed the current **shunt impedance limits on the HOMs from the crab cavities** at the [229<sup>th</sup> HSC meeting on 22/06/2020](#). These were recently used as specification in EDMS #1389669 v.2.55 (LHC-ACFDC-ES-0002 v.2.55), "*Engineering Specification for the dressed bulk niobium Crab Cavities*".

2016

In 2016 we gave limits for both single and coupled bunch instabilities.

Results are given for:

- 8 crab cavities (or 2/beam/plane)
- Ratio of beta function ~50
- Negative octupole current.

HOM tables:

- **DQW**: B. Xiao et al., "HOM impedance reference model v2", EDMS document n.1518298, 01 October 2015.
- **RFD**: Z. Li et al., "RFD-cav17f-HOM-qext-and-roq", EDMS document n.1523249, 27 June 2015.

Slides 2-3

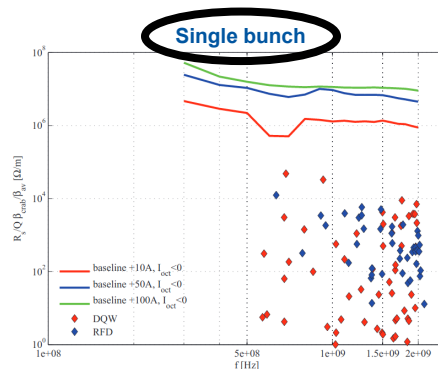

Figure 4: HOM of the DQW and RFD crab cavities and corresponding single bunch thresholds for the increase of octupole current over the machine baseline.

2016

- For coupled bunch instabilities, 920 MHz HOM was exceeding the +100A threshold.
- Minimum threshold identified and frequency dependent.
- Increase of ~10 A roughly below ~2e7/50 = 400 kOhm.m

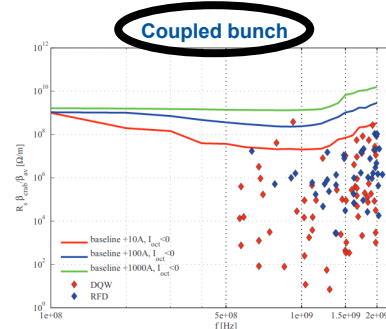

Figure 5: HOM of the DQW and RFD crab cavities and corresponding coupled bunch thresholds for the increase of octupole current over the machine baseline.

# Update of the limits on HOMs – single bunch

- **Limits revisited** using the updated version of the code (DELPHI) and the updated impedance model (results still **preliminary**) – HOMs from updated cavities are also shown:

B1, x, pos oct.,  $\epsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2 \text{ ns}$ ,  $N_b = 2.3e+11$ ,  $M=1$ , damp=0.01

B1, y, pos oct.,  $\epsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2 \text{ ns}$ ,  $N_b = 2.3e+11$ ,  $M=1$ , damp=0.01

⇒ **Far from the limit** (+10A) with most optics (but closer with **flat optics**),  
 ⇒ Strictest limit is in x and corresponds to a **R/Q** of resp. (800MHz < freq < 1GHz)  
**0.5 / 1.3 / 3 / 4.5 kOhm/m** for  $\beta^* = 15 / 40 / 85 / 140 \text{ cm}$ .

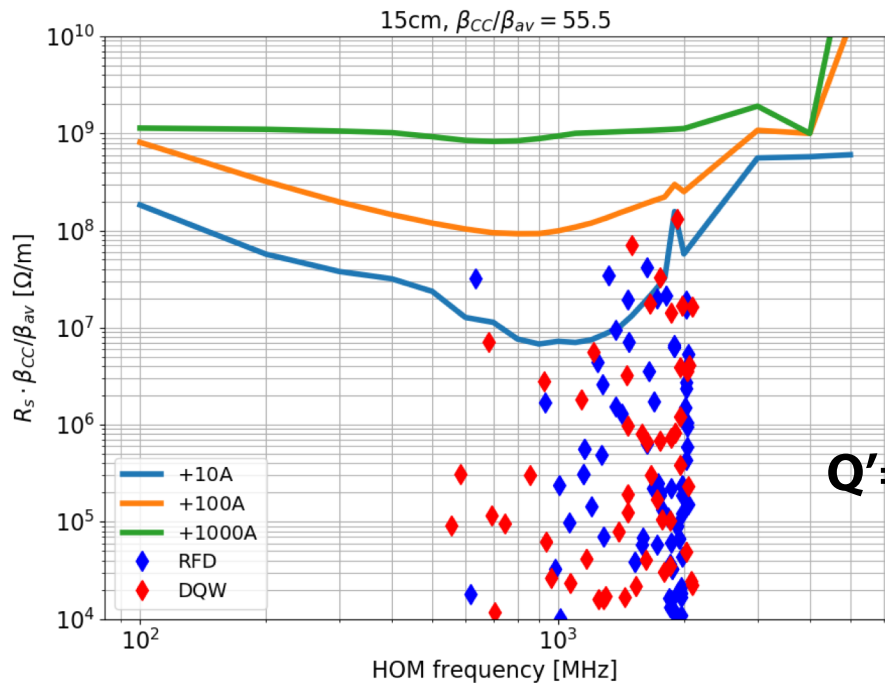

# Update of limits on HOMs – **multibunch**

$\beta^* = 15\text{cm}$  (updated crab cavity HOMs also shown)

B1, x, pos oct.,  $\varepsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

B1, y, pos oct.,  $\varepsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

TeleIndex=1

⇒ Some modes are above the limit.

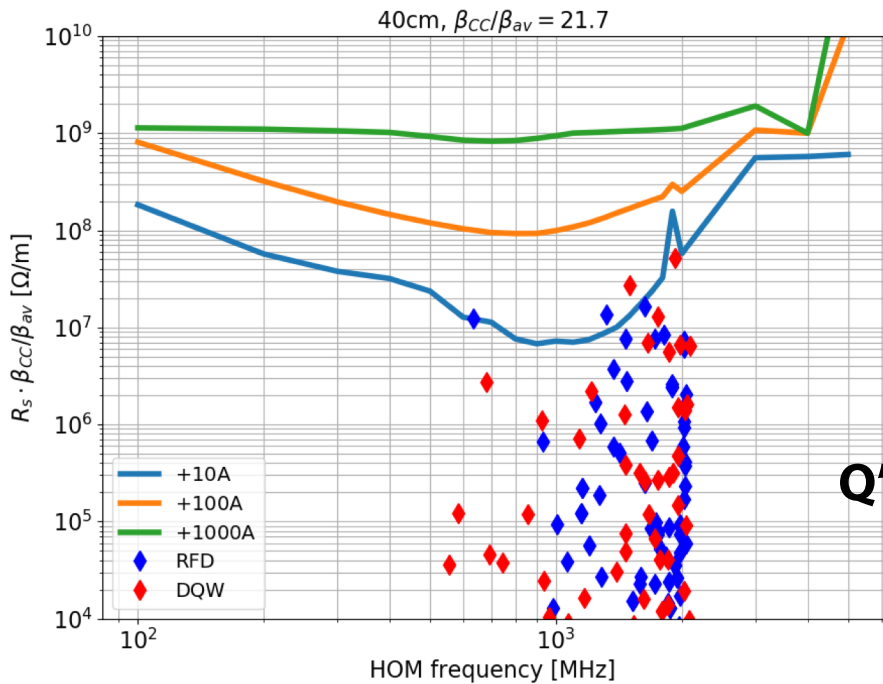

⇒ Strictest limit (in x) at **120 kOhm/m** for  $\beta^* = 15\text{cm}$ .

⇒ But this should happen only during collisions → stabilized by beam-beam.

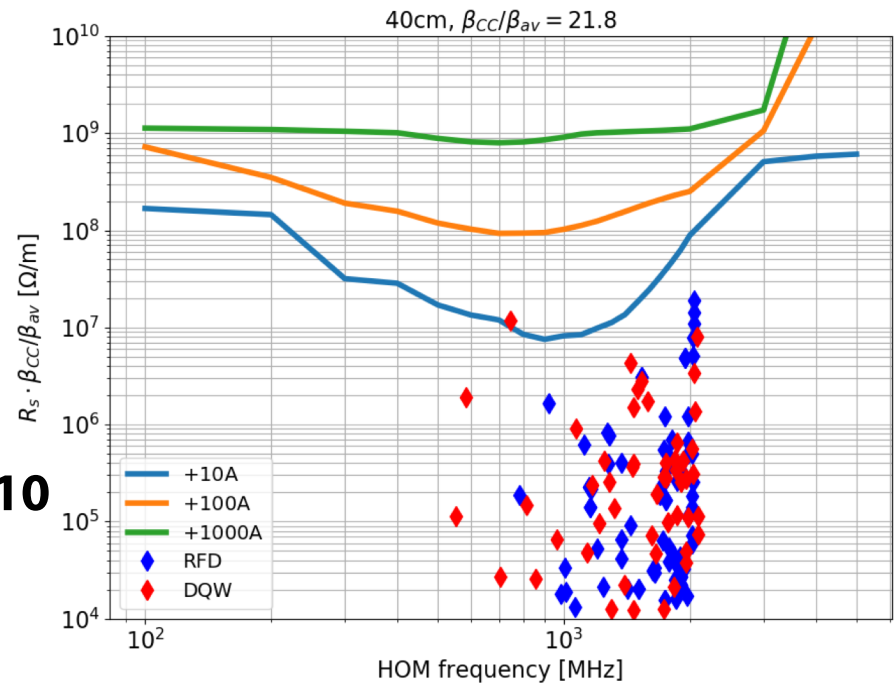

# Update of limits on HOMs – **multibunch**

$\beta^* = 40\text{cm}$  (updated crab cavity HOMs also shown)

B1, x, pos oct.,  $\epsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3\text{e}+11$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

B1, y, pos oct.,  $\epsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3\text{e}+11$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

TeleIndex=1

⇒ Close to the limit but ~OK.

⇒ Strictest limit (in x) at **300kOhm/m** for  $\beta^* = 40\text{cm}$ .

# Update of limits on HOMs – **multibunch**

$\beta^* = 140\text{cm}$  (updated crab cavity HOMs also shown)

B1, x, pos oct.,  $\epsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

B1, y, pos oct.,  $\epsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

TeleIndex=1

⇒ Fine for all modes.

⇒ Strictest limit (in x) at  $\sim 1\text{M}\Omega/\text{m}$  for  $\beta^* = 140\text{cm}$ .

# Conclusions

---

- Retraction of collimators has a strong impact on impedance and stability: **-20 to 25% less in single-beam octupole threshold.**
- Model was also updated for optics (v1.5), deformable RF fingers in the crab cavities, VELO in LHCb, and crab cavities HOMs, which all have a **smaller impact**, except in longitudinal.
- Limits on the high order modes from crab cavities are being reinvestigated with updated model and code – **preliminary results** show that:
  - ❑ in single-bunch, current crab cavities respect the +10A threshold with all optics &  $\beta^*$ ,
  - ❑ in coupled-bunch,  $\beta^*=40\text{cm}$  is close to the limit but still ~OK. Lower  $\beta^*$  can be problematic, but this should happen only during collisions where beam-beam tunespread will stabilize the beam.

---

# *Appendix*

# HL-LHC impedance model

---

- **Included** in the HL model:
  - ✓ **Collimator** at **almost full upgrade** (jaws of 2 TCPs and all but 2 TCSs in IR7 replaced by **Mo-graphite** ones, **Mo-coated** for the TCSs); some TCTs in Cu-coated copper-diamond; tungsten TCLD absorber in IR7,
  - ✓ Updated collimator **tapers** (**S. Antipov, E. Carideo**),
  - ✓ Beta functions in the arcs and triplets (optics v1.4),
  - ✓ **TDIS** (with graphite, Ti<sub>6</sub>Al<sub>4</sub>V and CuCr1Zr),
  - ✓ New **MKI-cool** – 4 of them,
  - ✓ New **octogonal beam screens** in triplets, with up-to-date dimensions, aC-coating, 75K copper, pumping holes and welds (**accurate weld & shape factors** from **C. Zannini**),
  - ✓ Updated experimental chambers (ATLAS & CMS),
  - ✓ Tapers and BPMs in the triplets region,
  - ✓ **Updated crab cavities** (2019 HOMs),
  - ✓ **Deformable RF-fingers**, VAX and Y-chambers in triplet region (including **new design for DRF in crab cavities** – **B. Salvant**),
  - ✓ **VELO** (**N. Biancacci** et al – *Elba, 30th May 2017*).

# HL-LHC impedance model

---

- Modifications that are **not** (yet) **in the model**:
  - X experimental chambers ALICE and LHCb, possibly also CMS,
  - X new instrumentation,
  - X possible aC-coating in some sectors,
  - X possible additional collimators in IR1 & 5, TCLD in IR2 (in parking for protons) and updated design of all tertiaries and TCLs, old CFC collimators in parking?
  - X crab cavities HOMs as measured in real cavities,
  - X electron lens and crystal collimators (recently added to baseline),
  - X new roman pots,
  - X “SMOG3” in LHCb.

# Retracted collimator settings

- Collimator settings **B1** ( $\sigma$  computed with  $\varepsilon = 2.5 \mu\text{m}\cdot\text{rad}$ ) at top energy – for **different  $\beta^*$**  (tables given as refs. are from *“HL-LHC Proton Operation Scenario – Update”* - unpublished yet)

Collimators	Half-gap [ $\# \sigma$ ] $\beta^*=40\text{cm}$	Half-gap [ $\# \sigma$ ], $\beta^*=85\text{cm}$ (Tab. 7, crab OFF, $250\mu\text{rad}$ )	Half-gap [ $\# \sigma$ ], $\beta^*=140\text{cm}$ (Tab. 5, crab ON, $190\mu\text{rad}$ )
TCP/TCS/TCLA(D) IR7	6.7 / 9.1 / 12.7 (16.6)	8.5 / 10.1 / 13.7 (16.6)	8.5 / 10.1 / 13.7 (16.6)
TCP/TCS/TCLA IR3	17.7 / 21.3 / 23.7	17.7 / 21.3 / 23.7	17.7 / 21.3 / 23.7
TCDQ/TCS IR6	10.1	11.6	11.6
TCT H4/V4/H6/V6 – IR1	16.4	25.4 / 27.8 / 22.3 / 30.9	29.8 / 37.0 / 24.0 / 41.9
TCT H4/V4/H6/V6 – IR5		25.5 / 27.8 / 22.4 / 30.9	29.9 / 37.0 / 24.1 / 42.2
TCL Q4/Q5/Q6 – IR1	22.4	34.6 / 37.8 / 39.8	46.2 / 56.3 / 44.8
TCL Q4/Q5/Q6 – IR5		34.7 / 38.0 / 39.6	46.3 / 56.5 / 43.2
TCT IR2/8	35.5 / 17.7	35.4 / 17.7	35.4 / 17.7

Note: injection protection collimators and TCLD in IR2 are all in parking position.

# Update of limits on HOMs – multibunch

$\beta^* = 85\text{cm}$  (updated crab cavity HOMs also shown)

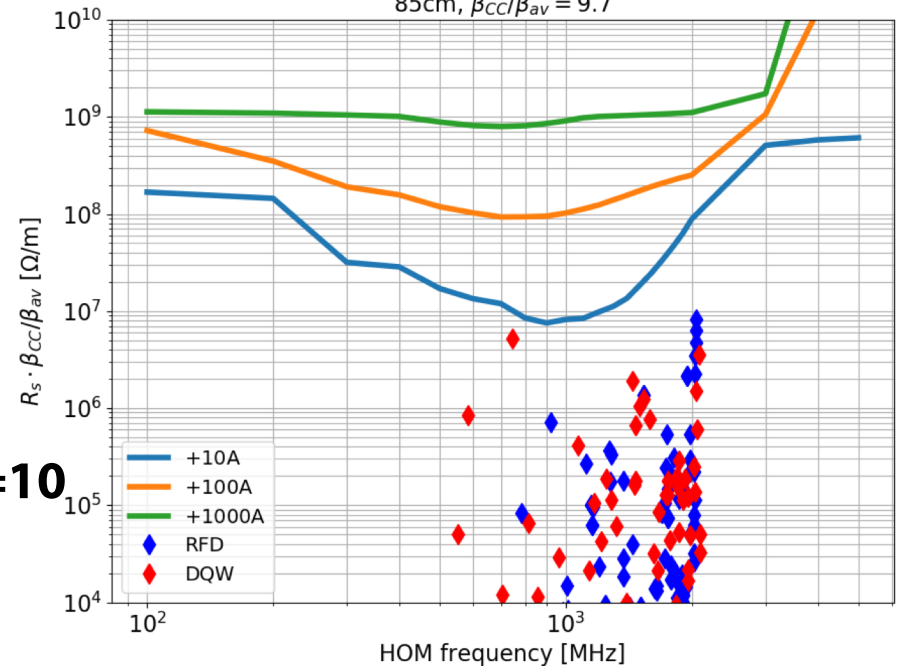

B1, x, pos oct.,  $\varepsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

85cm,  $\beta_{cc}/\beta_{av} = 10.0$

B1, y, pos oct.,  $\varepsilon = 2.1\mu\text{m}$ ,  $\tau_b = 1.2\text{ ns}$ ,  $N_b = 2.3 \times 10^{11}$ ,  $M = 3564$ ,  $\text{damp} = 0.01$

85cm,  $\beta_{cc}/\beta_{av} = 9.7$

TeleIndex=1

⇒ Fine for all modes.

⇒ Strictest limit (in x) at  $\sim 670\text{k}\Omega/\text{m}$  for  $\beta^* = 85\text{cm}$ .
