

Sources for high dose rate electron and proton irradiation at the ELBE center Dresden

U. Schramm

Helmholtz-Zentrum Dresden-Rossendorf

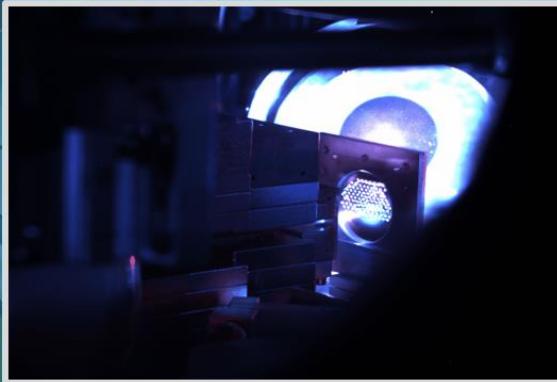

ATHENA

The Helmholtz-Project for
Laser-Plasma-Acceleration

Very High Energy Electron Radiotherapy Workshop (VHEE'2020)

Sources for high dose rate electron and proton irradiation at the ELBE center Dresden

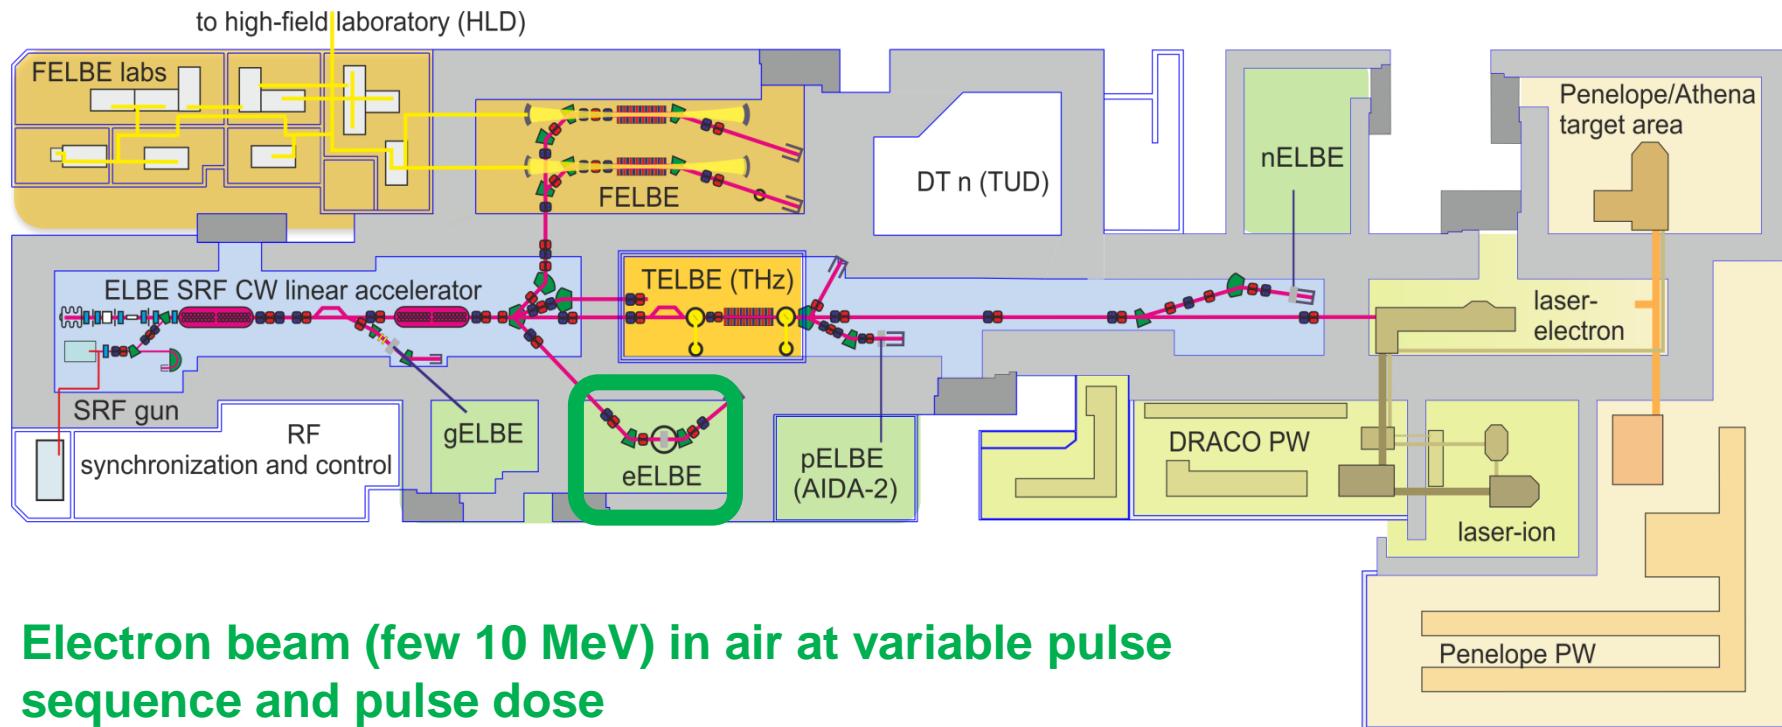

SRF CW electron linac

(operated as open user facilities)

PW laser driven plasma accelerators

Clinical cyclotron and other reference sources

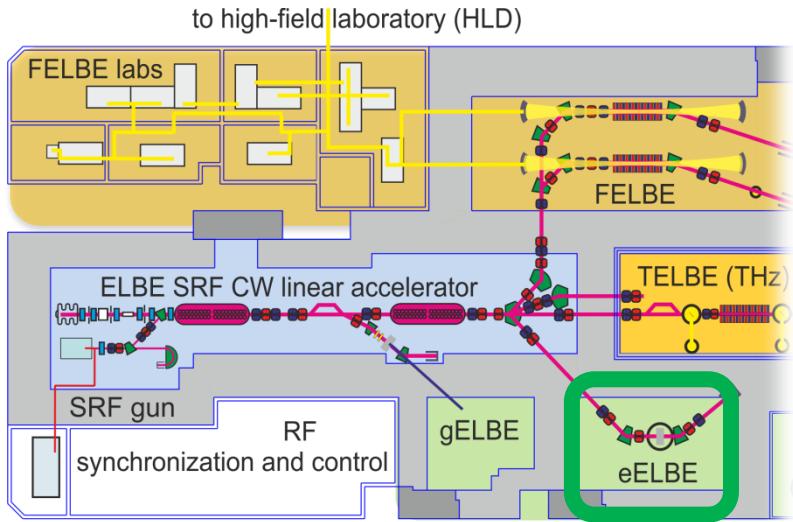

ELBE Center for high power radiation sources

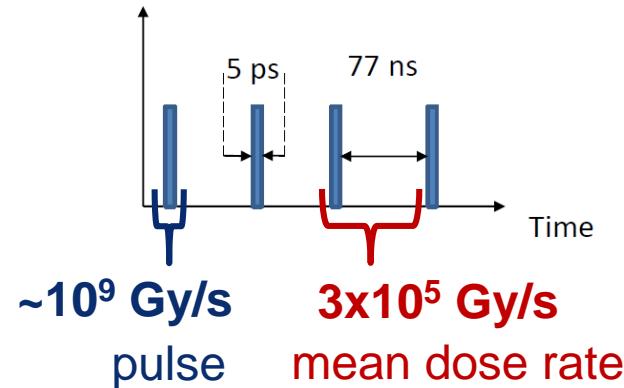

Electron beam (few 10 MeV) in air at variable pulse sequence and pulse dose

Advanced laser plasma accelerator development

ELBE Center for high power radiation sources

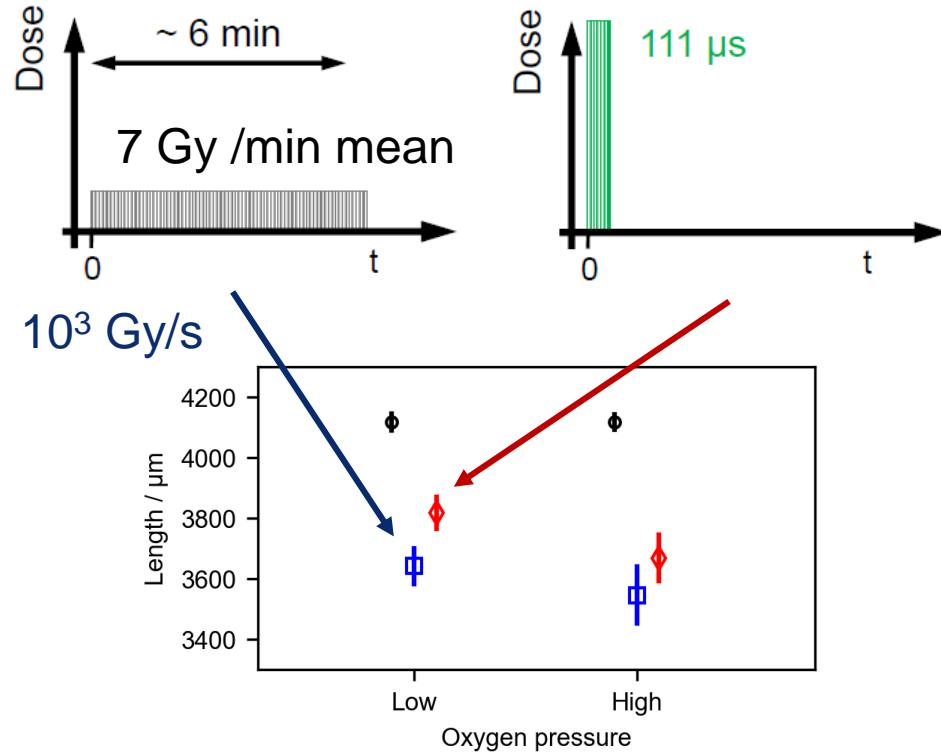

- Linear SRF accelerator with variable pulse sequence (max. rate 13 MHz)
- Short pulses (5ps) → high dose rate

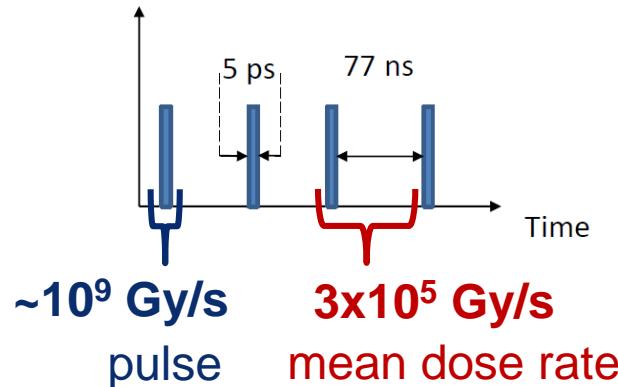

- Total dose determined by:
 - length of pulse train: e.g. 1400 pulses in 0.11ms → 33 Gy
 - bunch charge (between fC and ~100pC)

FLASH Experiments at ELBE (c.f. E. Beyreuther on Monday)

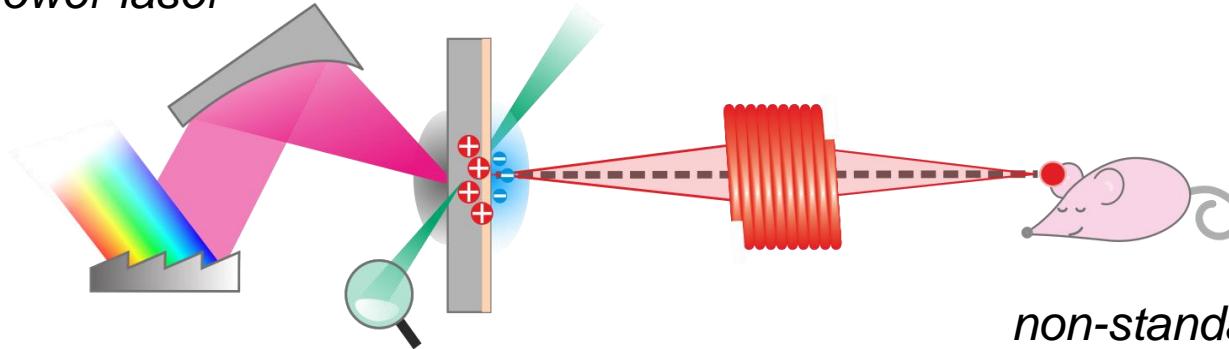

Linear SRF accelerator with variable pulse sequence (max. rate 13 MHz)
Short pulses (5ps) → high dose rate

Length of zebra fish embryos (28 hpf) depends on dose rate (and oxygen conc.)

First in-vivo proton irradiation at a compact laser plasma accelerator taking advantage of (and studying the role of) unique beam properties

high power laser

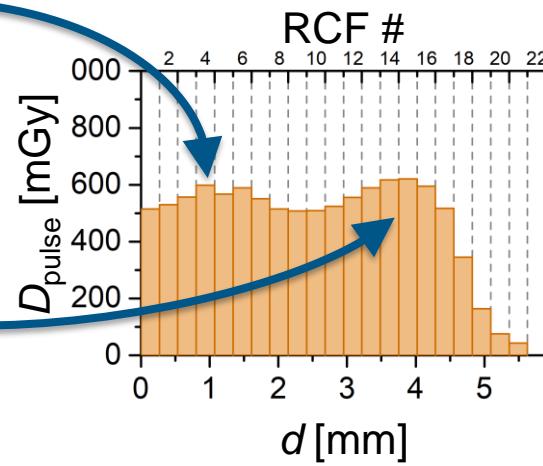

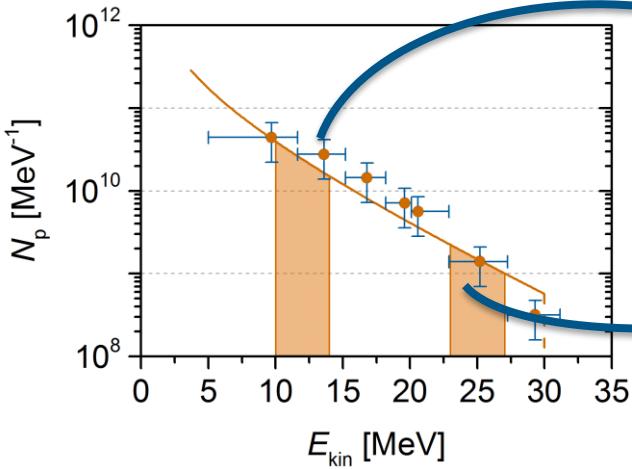

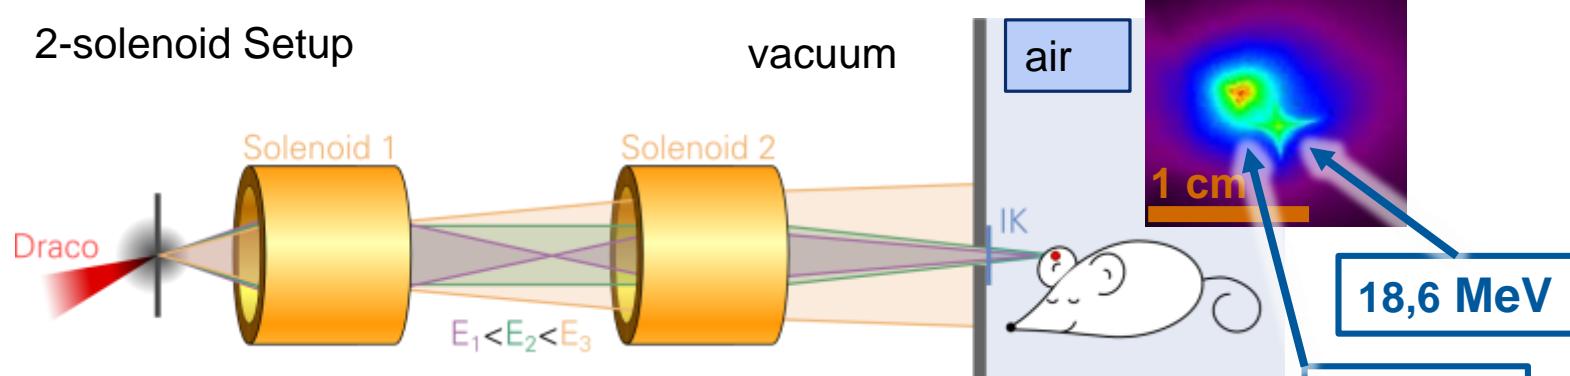

*compact plasma accelerator
pulsed poly-chromatic beam
high single pulse dose (rate)*

*compact pulsed magnet beam transport
generation of flat dose distribution in single pulse*

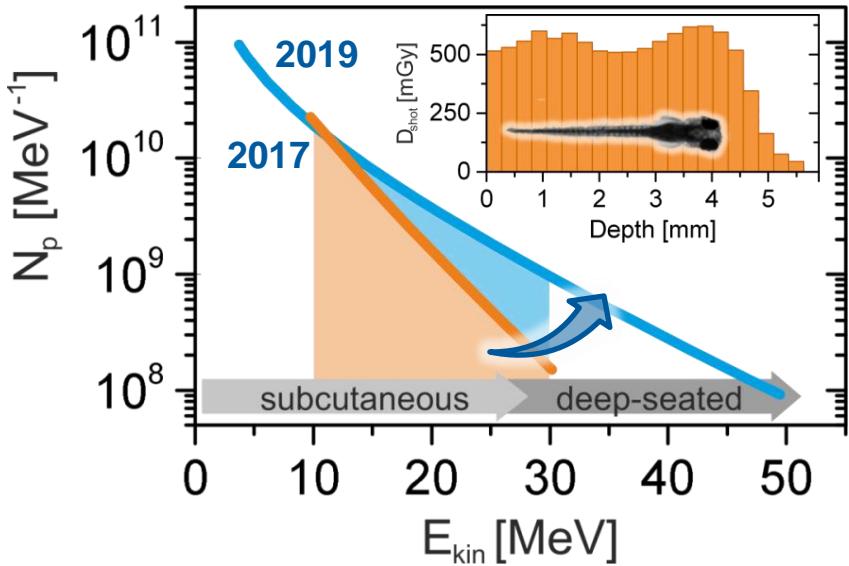

*non-standard dosimetry
dedicated tumor model
(mouse ear)*

Proton beam characteristics

2-solenoid Setup

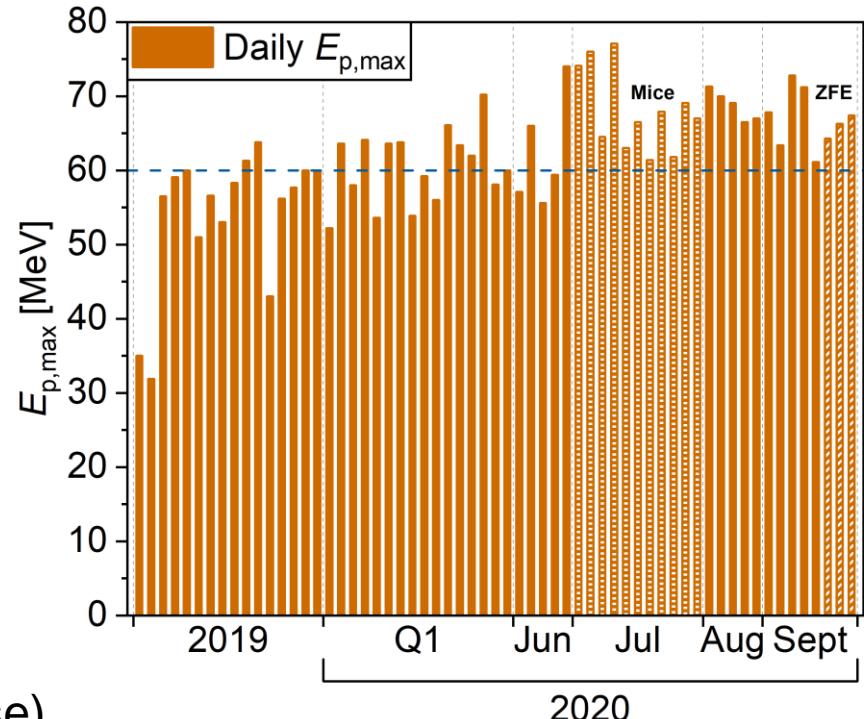

Recent progress in proton energies and operational stability

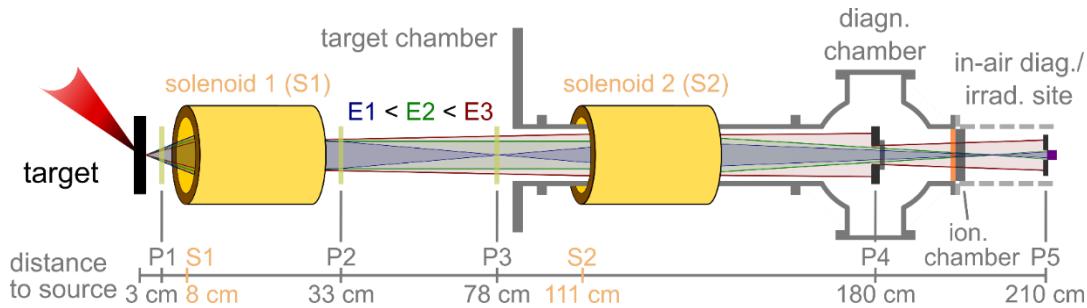

Tailoring the plasma for optimal efficiency
(either directly or via tailoring the laser pulse)

T. Ziegler, et al., arxiv:2007.11499 (2020)

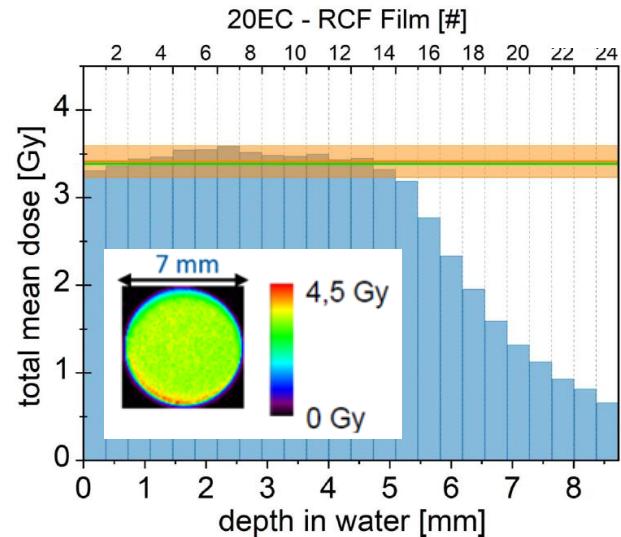

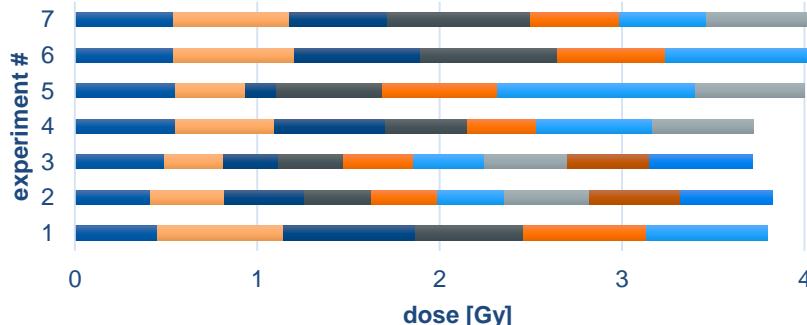

(based on ~15 J laser energy)

First in-vivo proton irradiation at a compact laser plasma accelerator

transferring intense
poly-chromatic proton pulse
into flat depth-dose

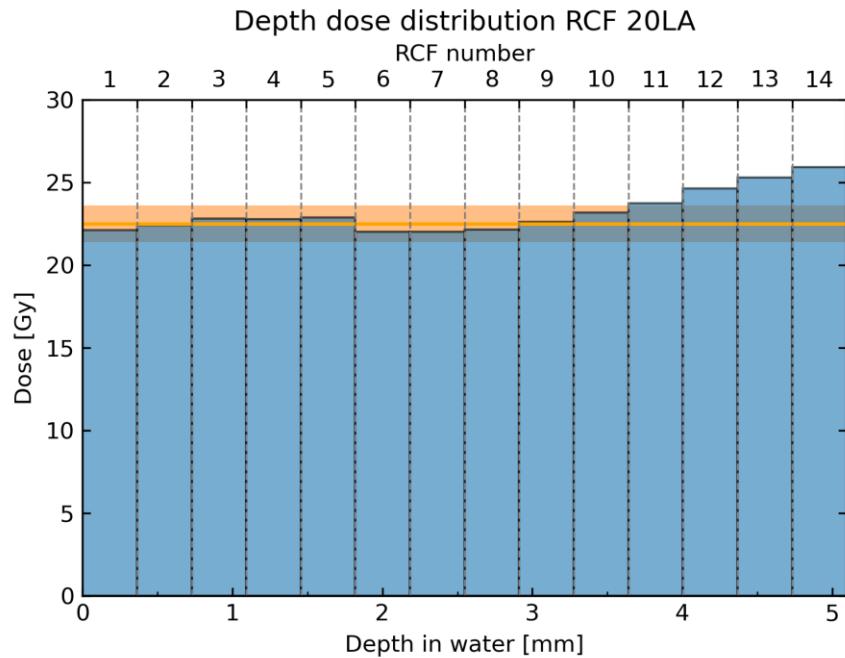

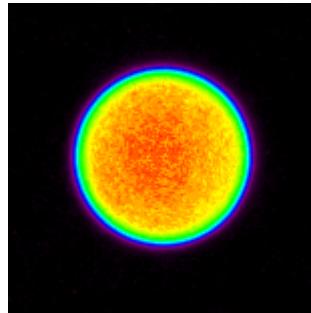

absolute and relative online dosimetry enables
monitoring of accumulated prescribed dose

Maximum dose at single pulse for studying dose rate effects

Optimization of transport filter for maximum pulse dose rate of up to 20 Gy in few ns

(reduction of stability and prescribed dose control)

Laser plasma proton acceleration

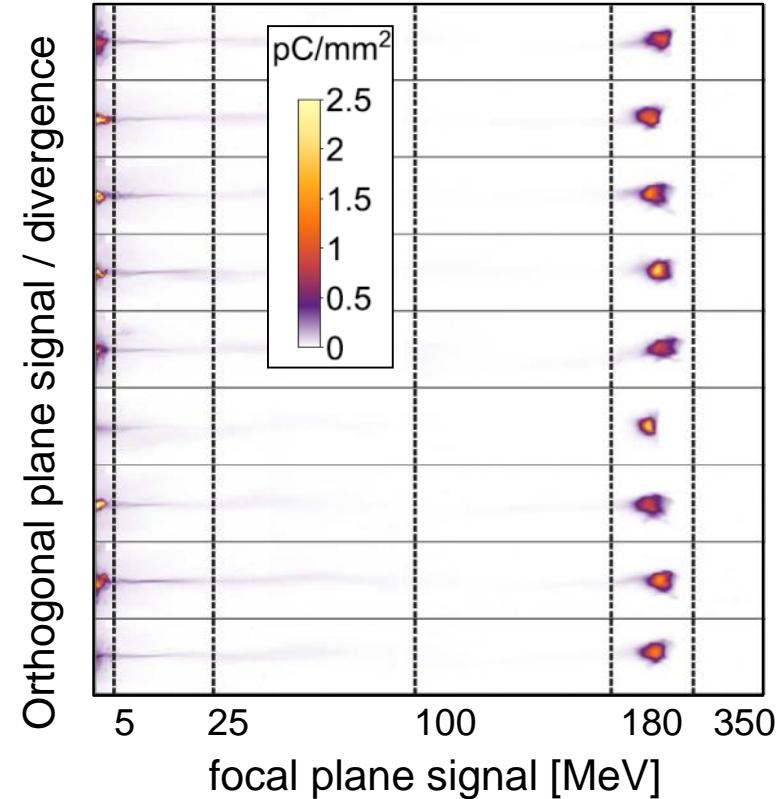

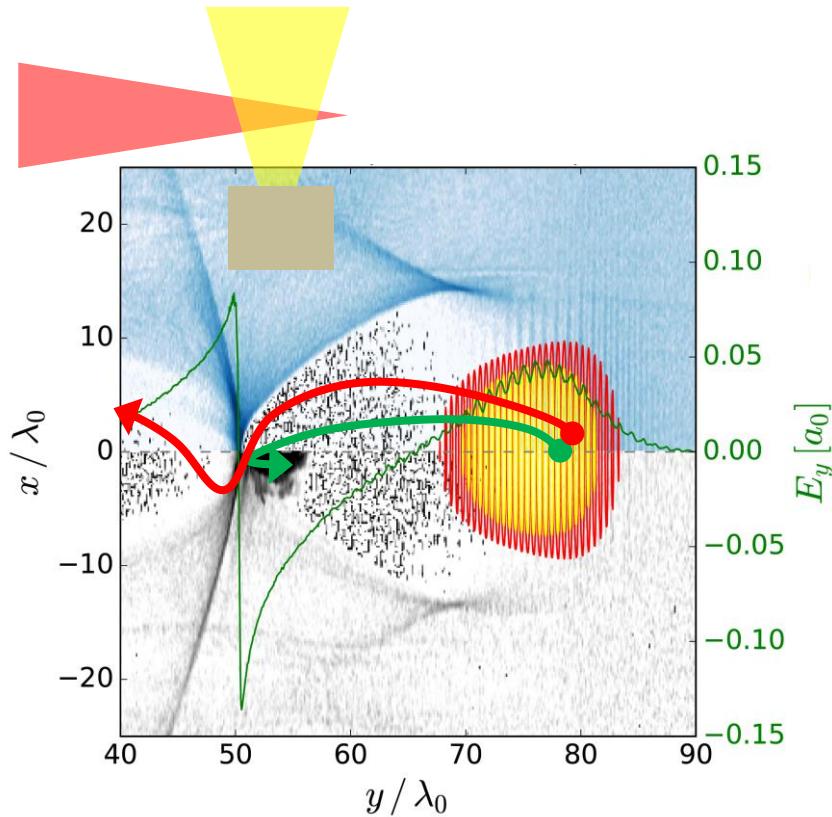

Demonstration of system readiness

- for systematic in-vivo radiobiology studies
(incl. full-scale reference irradiation protocols ...)
- for investigation of high dose rate effects
- for providing a compact platform for reference data generation

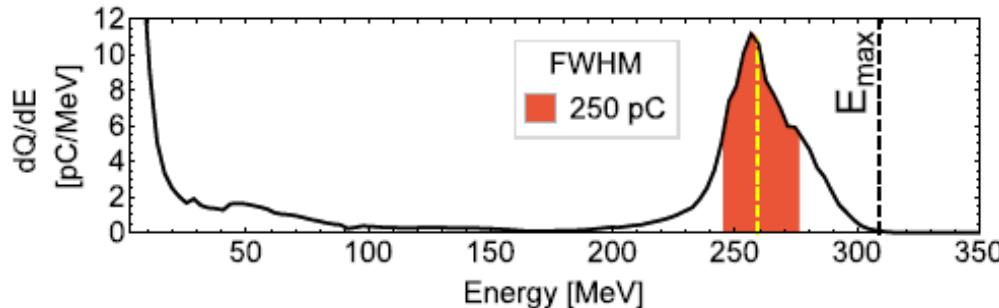

The Helmholtz-Project for
Laser-Plasma-Acceleration

Laser wakefield electron acceleration (VHEE)

J. Couperus, et al., Nat. Commun. 8, 487 (2017)

Laser wakefield electron acceleration (VHEE)

- Stable beam generation in the multi 100 MeV range
- Up to 500 pC charge at up to 10 (1) Hz repetition rate
- Bunch duration only \sim 10 fs (compare ELBE 5 ps)
(thus increasing pulse dose rate by x1000)

Compact source for VHEE but (still) limits in average dose rate
