In 1897, we discovered the electrons...

Skipping to 1937

And now:

And now:

How do we make sense of all this?

We found some symmetries

We found some symmetries

And organized the particles into 3 families

Let's focus on these 3

Let's focus on these 3

electron

muon (μ)

tau (τ)

We can think of them as flowers

electron (e)

muon (μ)

tau (τ)

Let's say a bee has to choose a flower

Let's say a bee has to choose a flower

It should choose randomly...

Now let's say we have many bees

Now let's say we have many bees

In a fair universe...

Now let's say we have many bees

In a fair universe...

Now let's say we have many bees

But what if?

\neq

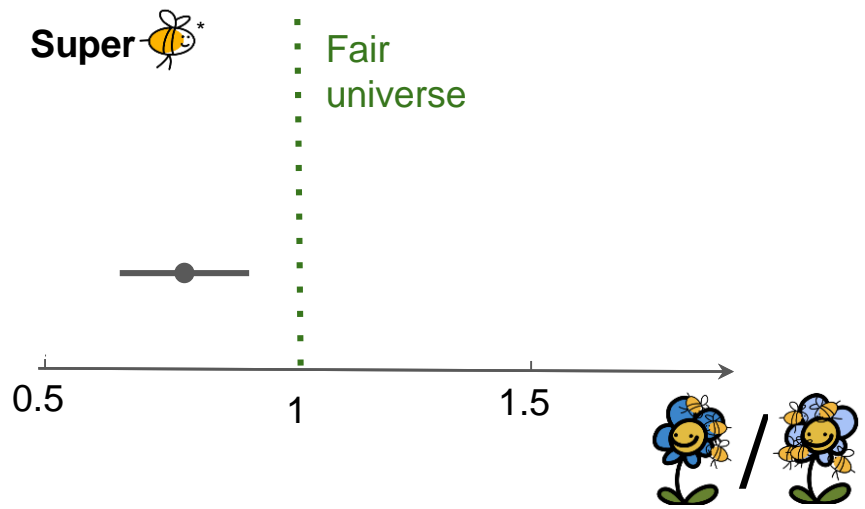

\neq

* The collaboration in this presentation is fictitious. No identification with actual collaborations (ongoing or finished) intended or should be inferred.

Could it be just a coincidence?

Or is there really a preference?

* The collaboration in this presentation is fictitious. No identification with actual collaborations (ongoing or finished) intended or should be inferred.

Super 

Fair
universe

Could it be just
a coincidence?

Time to go back to particles!

\neq

\neq

* The collaboration in this presentation is fictitious. No identification with actual collaborations (ongoing or finished) intended or should be inferred.

The flowers are the electron, muon and tau

electron (e)

muon (μ)

tau (τ)

The bees are particles called **B mesons**

electron (e)

muon (μ)

tau (τ)

Physicists are testing if **B mesons** have a preference for one of the three families

electron (e)

muon (μ)

tau (τ)

We produce **B mesons** using **large particle colliders**

Particle collisions produce a lot of energy

And many new particles appear... including B mesons

B mesons are not stable particles,
they can decay to:

or

or

B mesons are not stable particles, they can decay to:

or

or

With our detectors we can look for:

And like with the flowers, calculate a ratio:

$$R_K = \frac{\mathcal{B}(B^+ \rightarrow K^+ \mu^+ \mu^-)}{\mathcal{B}(B^+ \rightarrow J/\psi(\rightarrow \mu^+ \mu^-) K^+)} / \frac{\mathcal{B}(B^+ \rightarrow K^+ e^+ e^-)}{\mathcal{B}(B^+ \rightarrow J/\psi(\rightarrow e^+ e^-) K^+)}$$

And like with the flowers, calculate a ratio:

Too complicated!

$$R_K \sim \frac{\begin{array}{c} \text{flower} \\ \text{green smiley} \rightarrow \text{blue smiley} \text{ flower} \end{array}}{\begin{array}{c} \text{flower} \\ \text{green smiley} \rightarrow \text{blue smiley} \text{ electric} \end{array}}$$

And like with the flowers, calculate a ratio:

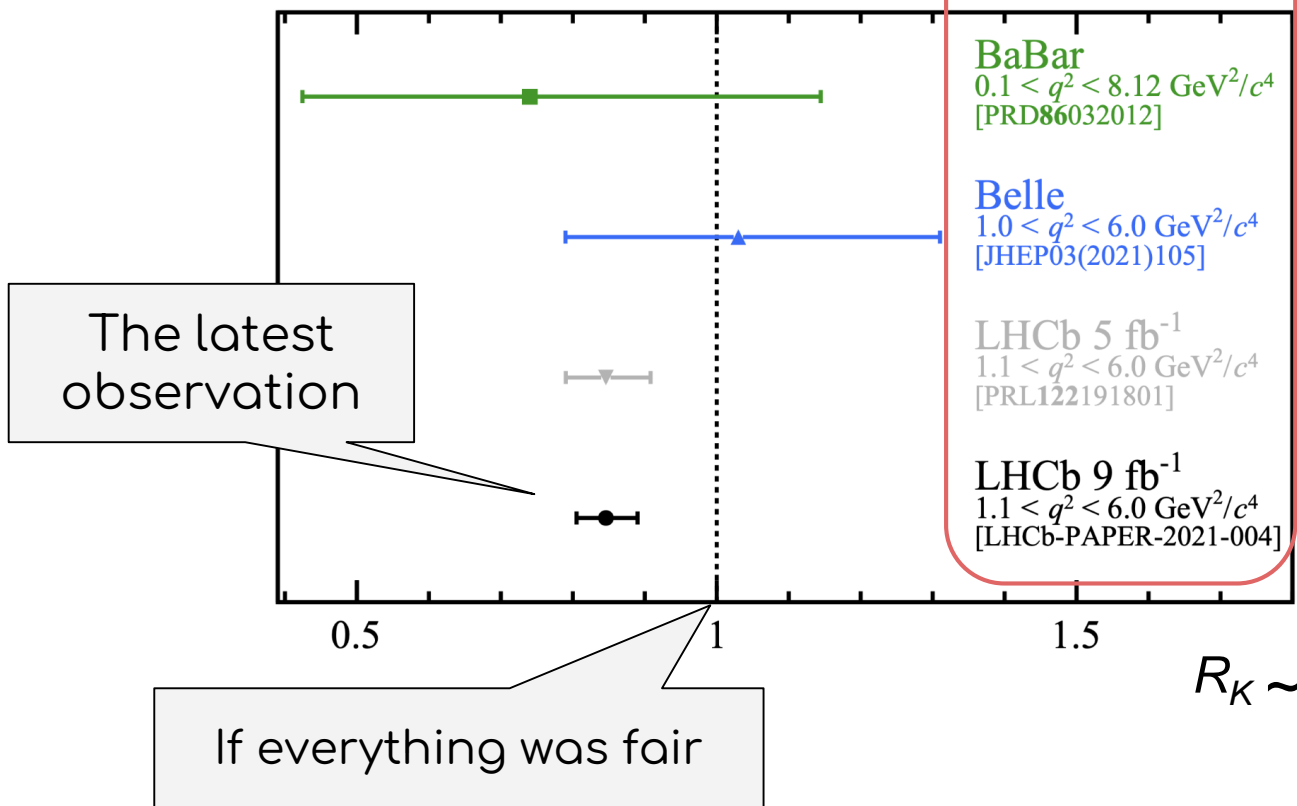

Too complicated!

Bs prefer electrons or muons?

If no preference, $R_K=1$

We observe this:

There is indication that the universe might not be fair...

But we are still not sure...
we need more bees!

There is indication that the universe might not be fair...

But we are still not sure...
we need more bees!

There is indication that the universe might not be fair...
