

# Status of EW precision subgroup

LHC EW WG meeting

October 9, 2020

Aram Apyan, Fulvio Piccinini, Daniel Froidevaux  
For the LHC EW precision subgroup

# LHC EW precision subgroup

---

- Main areas of work within the LHC precision subgroup:
  - pT W, Z, and W/Z resummation benchmarking
    - Discussed in Tom's talk yesterday
  - QED/EW corrections for precision EW measurements (Z DY and s<sup>2</sup>weff observables)
    - Studies for W mass will come next
  - PDF benchmarking exercise using LHC precision EW data and pseudodata
    - Discussed in Robert's talk yesterday
  - Pseudodata for combination of sin<sup>2</sup>θ<sub>eff</sub> measurements with full run-2 data
  - Pseudodata for combination of full run-2 pTZ and DY measurements
  - Work toward a combination of M<sub>W</sub>
    - Discussed in Chris's talk yesterday
  - Photon-induced process in DY measurements and s<sup>2</sup>weff observables

# Preparation of LHC combination for $\sin^2\theta_{\text{eff}}$

- Focus on LHC experiments with full Run-2 dataset
- Important that experiments use same (equivalent models) to interpret data and treat common uncertainty sources consistently to produce final combined measurement
- Longer-term may produce a combined measurement (A4 for example)

- Compare and combine pseudodata of measurements of  $A_4$  at different experiments.

- Use a common framework for these studies:

- POWHEG + Pythia8; LO EW, NLO(+PS) QCD

- PDF: NNPDF31\_nnlo\_as\_0118\_hessian

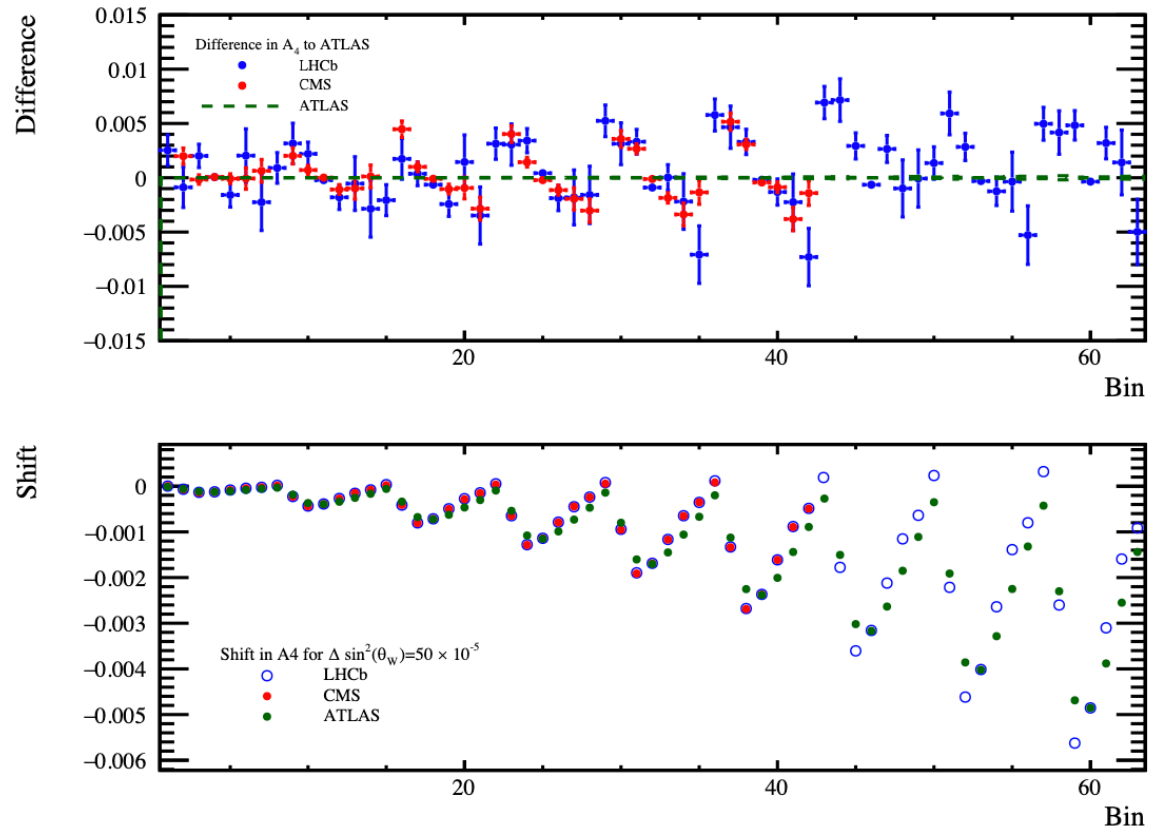

- Bins of width 0.4 in  $|y|$

- 7 bins in dimuon invariant mass: {50, 66, 76, 86, 96, 106, 116, 150 GeV}

# Goal of pseudodata exercise

- Goal is to provide guidelines in Yellow Report of how experimental data should be published such that an LHC-wide combination could be obtained swiftly once all experiments will have published their results
- We have pseudodata for ATLAS, CMS, and LHCb
- Excellent agreement on the Z peak for  $A_4$
- We also have pseudodata using Powheg-EW with  $s_{2\text{eff}}$  input scheme with and without EW corrections
- There is still work to do to have confidence that all of this can be ready within next months

# Preparation of LHC combination for $\sin^2\theta_{\text{eff}}$

- YR will hopefully contain a section as below which would really be useful as a concrete example of how the weak mixing angle measurements of the three experiments could be combined with a proper correlation treatment of all common theoretical uncertainties

4	A possible strategy for run-2 measurements and combinations at the LHC	26
4.1	Introduction	26
4.2	Observables used for comparisons of expectations between experiments : $A_4$ and $A_{FB}$	26
4.2.1	Pseudo-data representing full run-2 dataset for ATLAS, CMS and LHCb	26
4.2.2	Compatibility tests between experimental pseudo-data	26
4.2.3	Combination of experimental pseudo-data	26
4.3	Interpretation tools	26
4.3.1	QCD tools: DYTurbo, NNLOJET	26
4.3.2	QED/EW tools: Dizet, Powheg EW, MC-SANC, ZGRAD2	26
4.4	Combined interpretation of experimental measurements	26
4.4.1	Profile likelihood fit to combination of experimental pseudo-data	26
4.4.2	Direct extraction of weak mixing angle based on fit of all experimental measurements	26
4.5	Expected breakdown of uncertainties and conclusions	26
4.5.1	Measurement uncertainties	26
4.5.2	PDF uncertainties	26
4.5.3	QED/EW uncertainties	26
4.5.4	QCD uncertainties	26
4.5.5	Parametric uncertainties	26
4.6	Impact on electroweak fit	26
4.7	Conclusions	26

# QED/EW corrections benchmarking

- Benchmark different aspects of the interpretation framework
  - Cross sections and  $A_{fb}$
- Part 1: QED ISR and IFI
  - MCSANC, Powheg-EW, KKMC-hh, WZGRAD2
  - Diversity in calculations is a strength of the group. For example, KKMC-hh deals with ISR by explicitly calculating the collinear terms rather than letting them be absorbed into PDFs
    - Need to include all photon-induced processes (gamma-gamma, quark-gamma) once one includes QED ISR/IFI. Work ongoing using HORACE at LO QCD
    - Nontrivial distortion of AFB distribution with photon-induced contributions (using NNPDF31 luxqed PDF), work in progress
      - <https://indico.cern.ch/event/829225/contributions/3481095/attachments/1871900/3100939/Vicini-EWWG-01jul19.pdf>
  - There is progress here since last year and hope to converge next few months

# QED/EW corrections benchmarking

---

- Benchmark different aspects of the interpretation framework
  - Cross sections and  $A_{fb}$
- Part 2: virtual EW corrections: NLO, NLO+HO
  - Comparisons with TauSpinner+DIZET, POWHEG-EW, MCSANC, and WZGRAD2
  - Comparisons done using LO QCD for now. The higher order QCD corrections should not change the picture (results are discussed relative to LO EW). The impact of NLO QCD will be checked with Powheg-EW in the last stages of benchmarking
    - The impact of NLO QCD also checked with DIZET

# EW schemes: benchmark input parameters

SM relation used to calculate **EW LO parameters** for different schemes. On-shell mass.

	LEP-legacy		LHC-paradigm		New scheme
Parameter	$(\alpha(0), G_\mu, M_Z)$ $\alpha(0)$ v0	$(\alpha(0), M_W, M_Z)$ $\alpha(0)$ v1	$(G_\mu, M_Z, M_W)$ $G_\mu$	$(\alpha(0), s_W^2, M_Z)$ $\sin_{eff}^2$ v1	$(G_\mu, s_W^2, M_Z)$ $\sin_{eff}^2$ v2
$M_Z$ (GeV)	91.1876	91.1876	91.1876	91.1876	91.1876

TauSpinner+DIZET (estimated)	-0.01508(0)	-0.01104(0)	-0.01515(0)	-0.00684

- Smaller impact of NLO+HO corrections on observables of interest. To be validated precisely including the parametric uncertainties

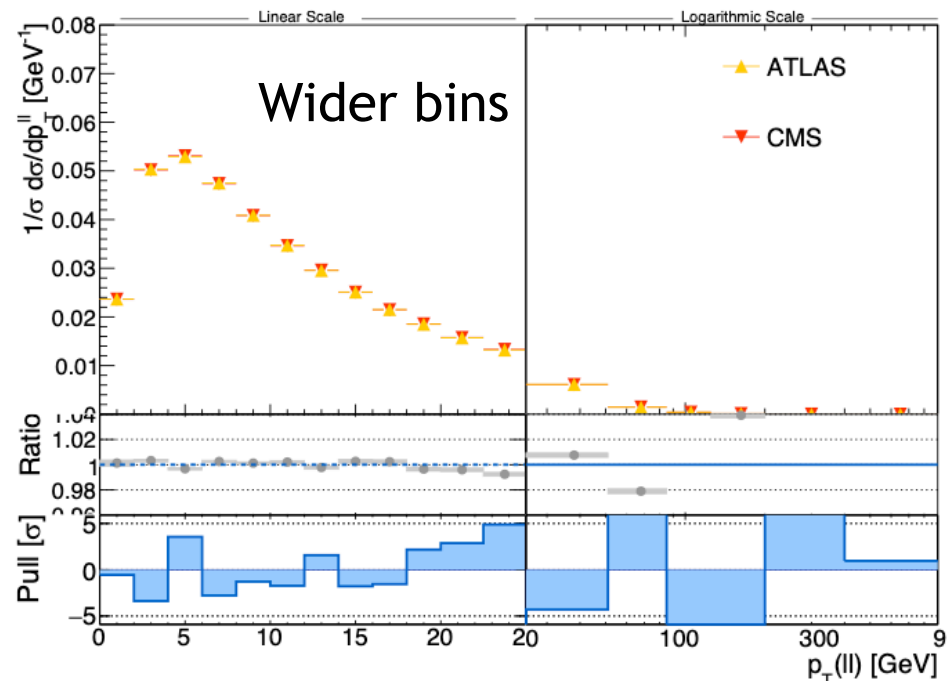

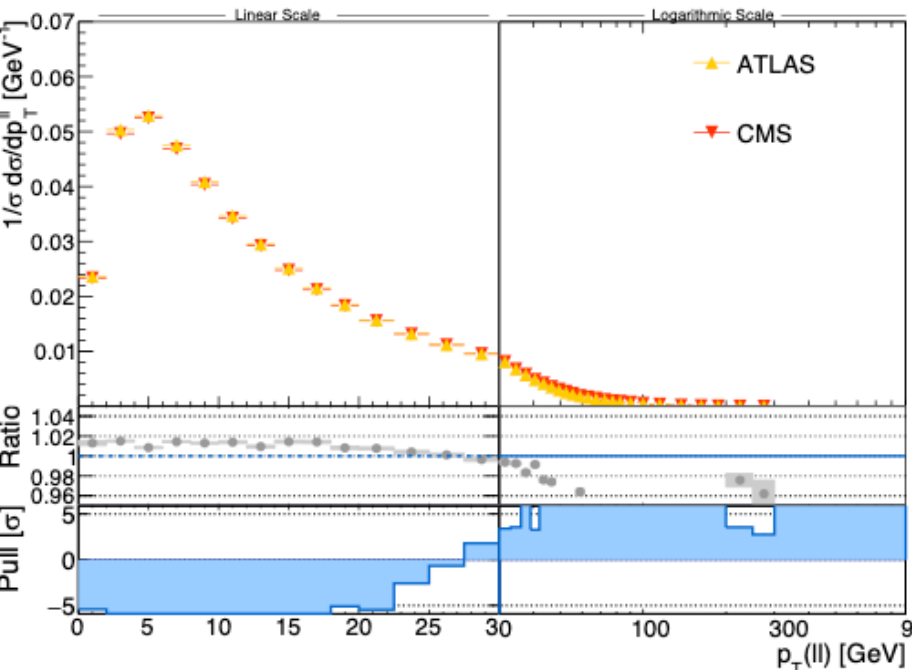

# QED/EW corrections benchmarking

---

- Understanding the Afb difference at NLO is work in progress
  - The work has brought us many improvements and convergences between different calculations
- Very good agreement between Powheg\_EW and MCSANC for delta\_Afb between NLO+HO and NLO
  - In both  $G_\mu$  and  $\alpha(0)v1$  schemes
  - (NLO+HO)-NLO numbers are larger than the differences we observe at NLO. HO corrections are indeed needed.
- Two additional schemes considered but for them we only have one calculation for now
  - $\alpha(0)v0$  used for the LEP/SLD combination. Our baseline and reference numbers from DIZET 6.48
  - Recently proposed  $s2weff$  input scheme available with Powheg-EW

# pT Z combination

- Recent exercise to compare CMS and ATLAS 13 TeV measurements
  - Arxiv: [1912.02844](#), [1909.04133](#)
- Correct for differences in fiducial volume definition using transfer factors
- Binning is not the same. Use linear interpolation to rebin
  - Bias in interpolation? Better agreement using wider bins for  $p_T > 25 \text{ GeV}$

# pT Z combination

Measured cross sections:

- ATLAS ( $p_T(Z) > 25$  GeV):  $1/\sigma d\sigma/dp_T(Z) = 0.23934290$  pb
- ATLAS ( $2 < p_T(Z) < 25$  GeV):  $1/\sigma d\sigma/dp_T(Z) = 0.71235850$  pb
- CMS cross sections corrected for fiducial phase space differences from above
  - CMS ( $p_T(Z) > 25$  GeV):  $1/\sigma d\sigma/dp_T(Z) = 0.24058156$  pb
  - CMS ( $2 < p_T(Z) < 25$  GeV):  $1/\sigma d\sigma/dp_T(Z) = 0.70262592$  pb

- The two measurements are largely in agreement given the ‘quality’ of the comparison
- Lessons learned for the future:
  - Agree on at least one common binning having the combination in mind (the experiments can still keep the ‘detector’ optimized versions’)
  - Define a common fiducial volume and provide results as a supplementary material perhaps
  - Agree on “what is signal and what is background”
    - ATLAS subtracts photon-induced process CMS does not for this particular measurement
    - Talk by Laurent on improved generators (LPAIR, SuperChic): <https://indico.cern.ch/event/961431/>
    - Dedicated discussions within LHC EW subgroup on the treatment of photon induced backgrounds in several DY measurements:

# YR reports and publications

---

- Possibly three+ publications will come out from the work done in the precision EW group
  - Resummation benchmarking of  $p_{TW}$ ,  $p_{TZ}$ , and  $p_T W/Z$
  - QED/EW corrections for precision EW measurements ( $s_2^{\text{weff}}$  and  $m_W$ )
  - PDF benchmarking
  - ...
- The Yellow report(s) will be more extensive in terms of topics than specific publications, but might be more concise concerning the work published in the corresponding publications referring to them for details
- YR reports can include more material at the boundary between theory and experiment while obeying the publication rules of the experiments. Examples of such material are the ongoing pseudodata studies for the full run-2 LHC combination of the weak mixing angle measurement, and more recently the studies just beginning of a run-2 combination of Z  $p_T$  measurements.

# Timelines

---

- We had a consensus that this year should be publication time and that we should push for convergence and reduction of certain ambitions if time is too short
  - We are now October 2020 with Covid crisis past few months
- Aim to achieve the same goals by April 2021 or at least by summer 2021
  - This would require results by the end of this year or latest by March-April next year
- Few areas naturally allow to start writing up while the work is ongoing:
  - QED/EW corrections for example: <https://gitlab.cern.ch/lhcewkg/lhcewkg-precisionEW/documentation/-/tree/qedew-corrections/qedew-corrections>
  - pT W/Z resummation benchmarking is another area where we plan to start the process of documenting the results this year as Level 1 and 2 benchmarking results are mature

# **ADDITIONAL MATERIAL**
