

# Search of pion in chargino decay

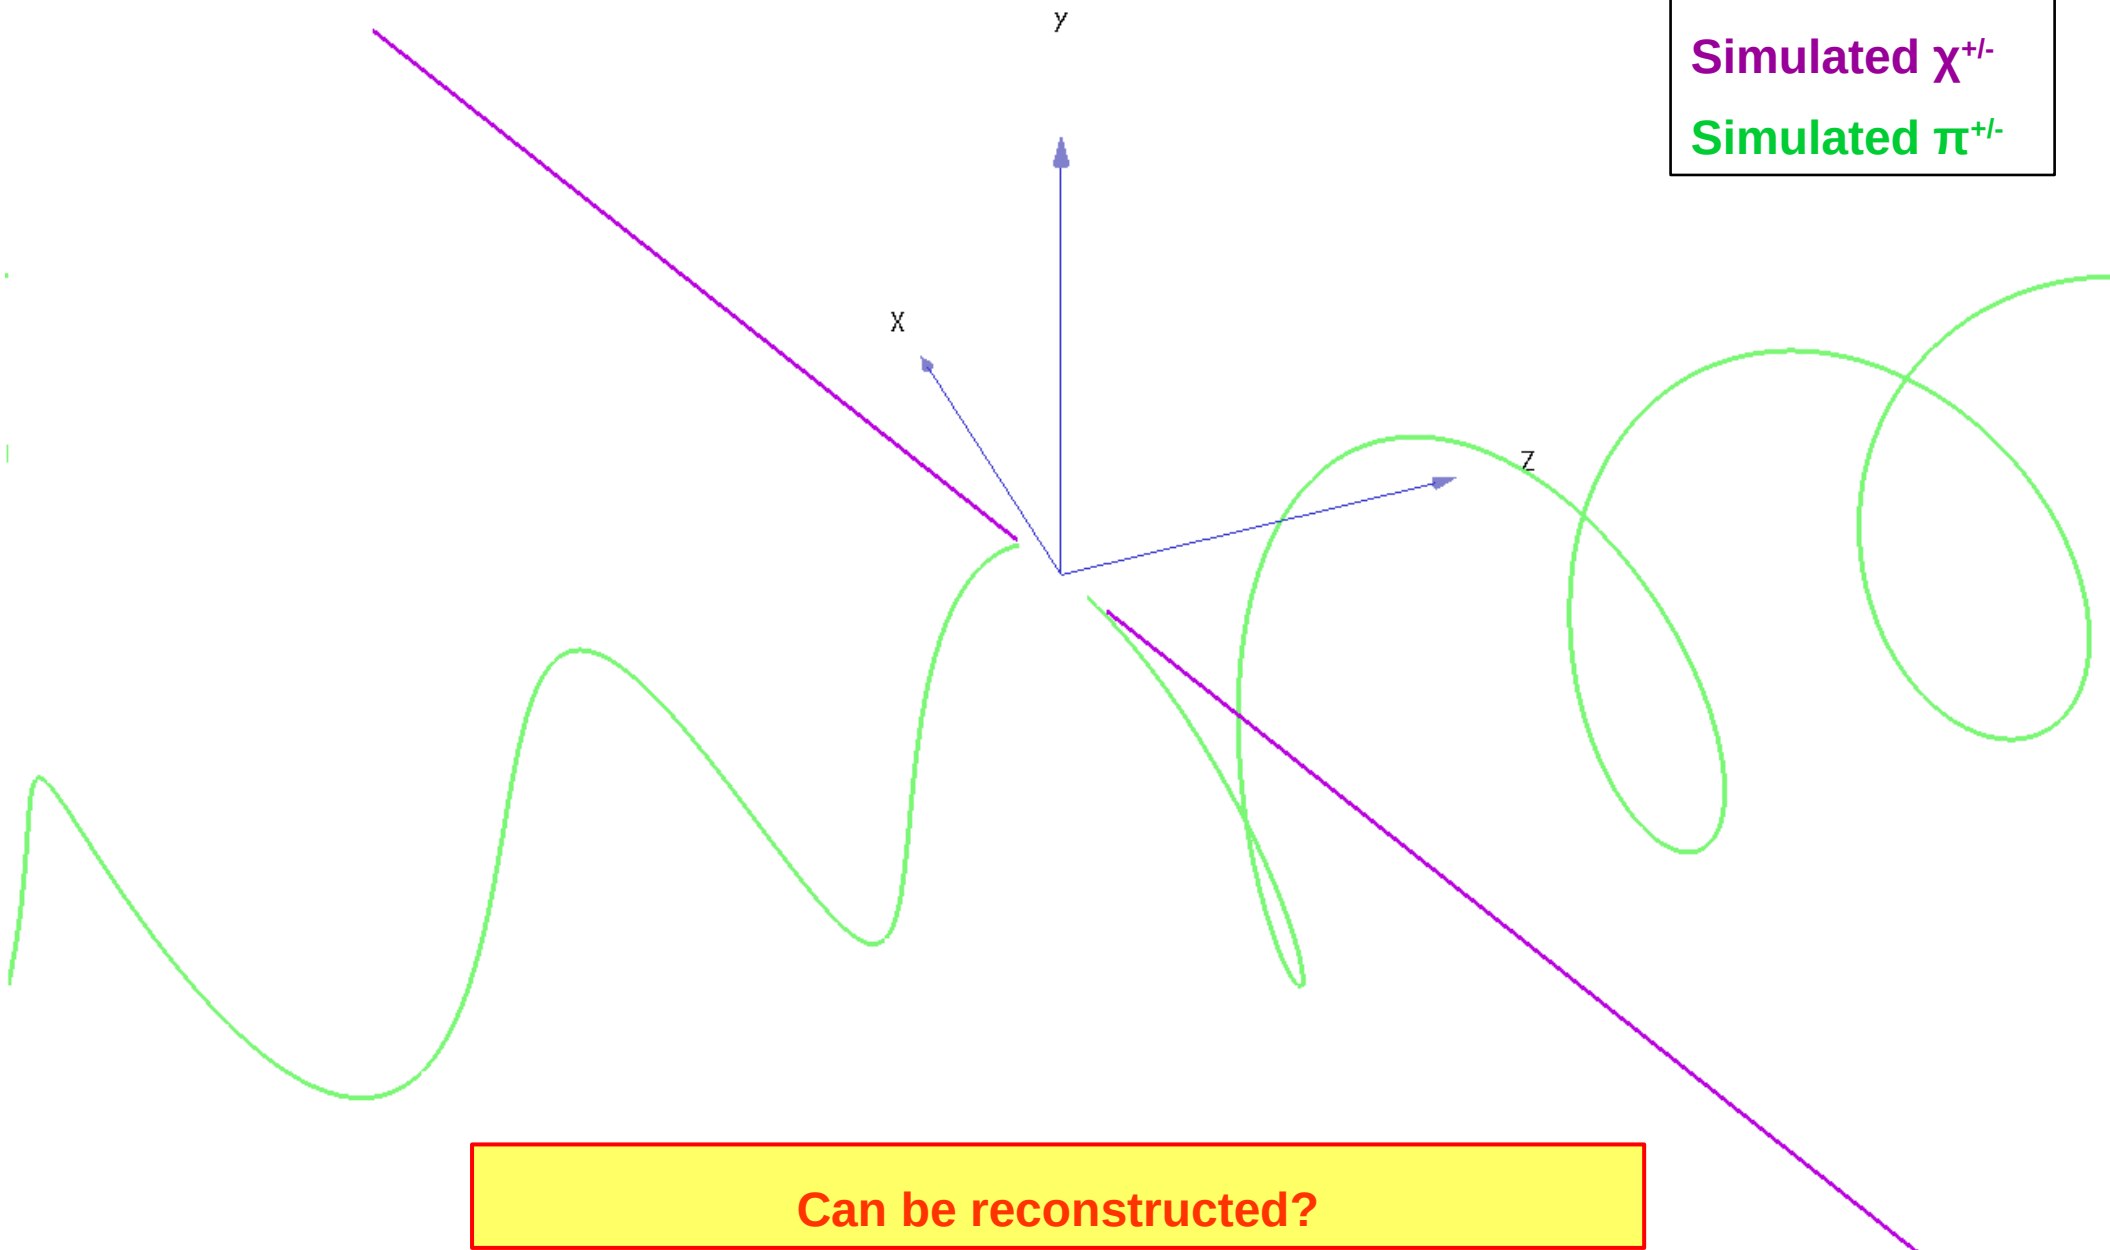

Erica Brondolin, Ulrike Schnoor

CLICdp Analysis Meeting  
28<sup>st</sup> July 2020

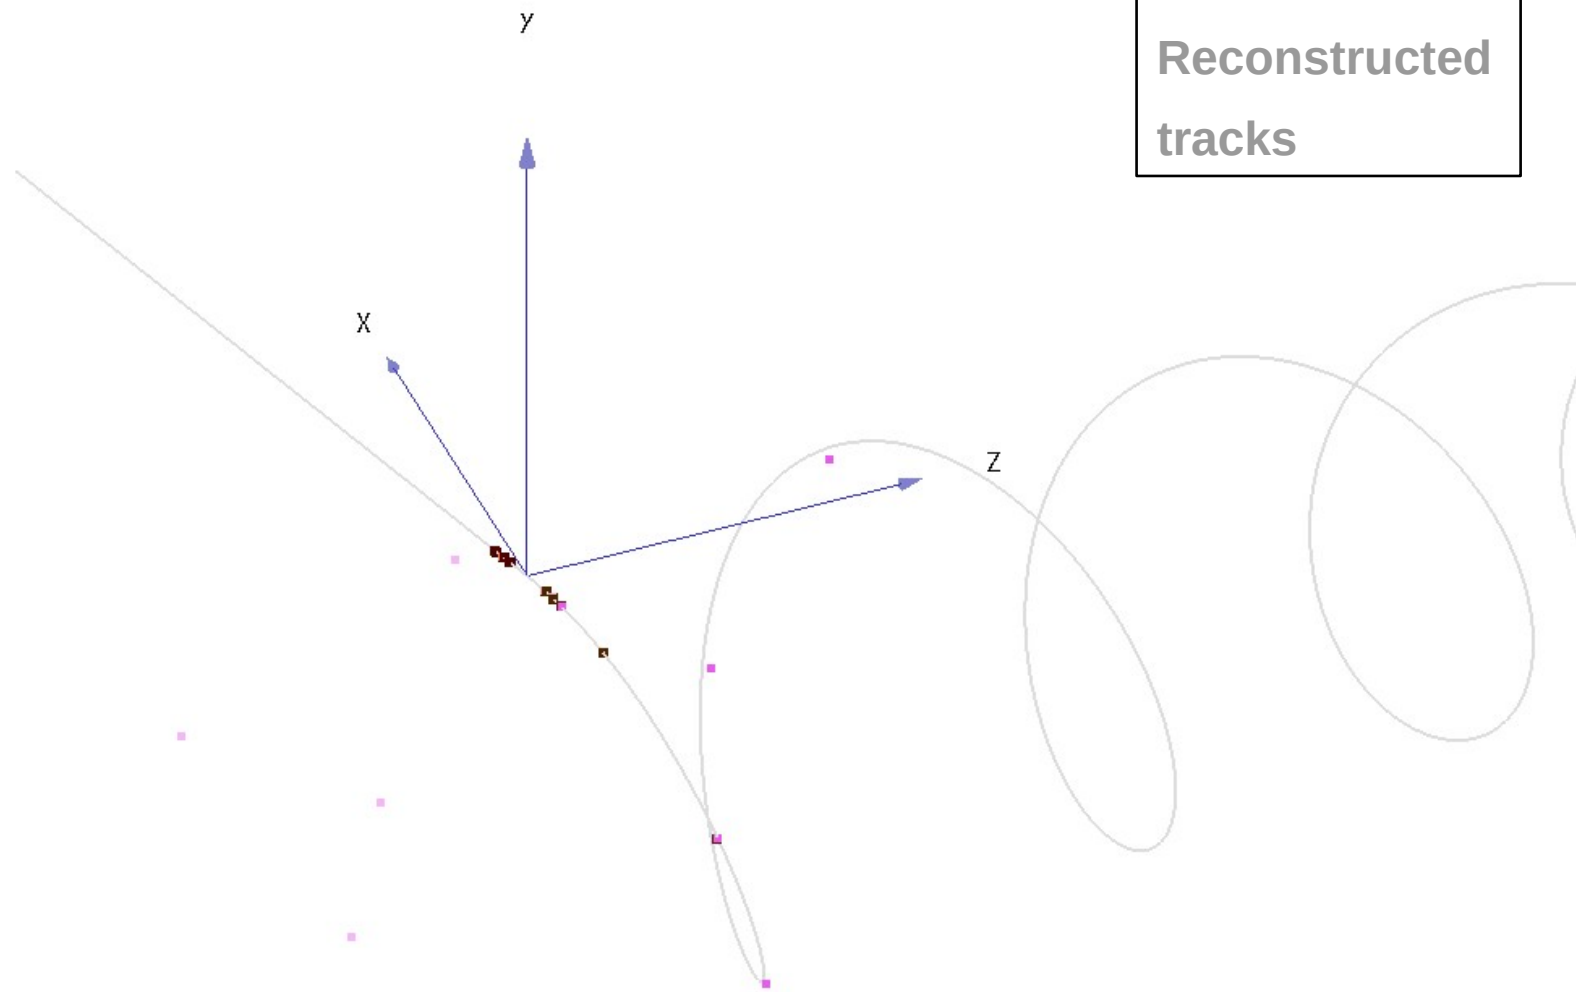

# One event

Simulated  $\chi^{+/-}$

Simulated  $\pi^{+/-}$

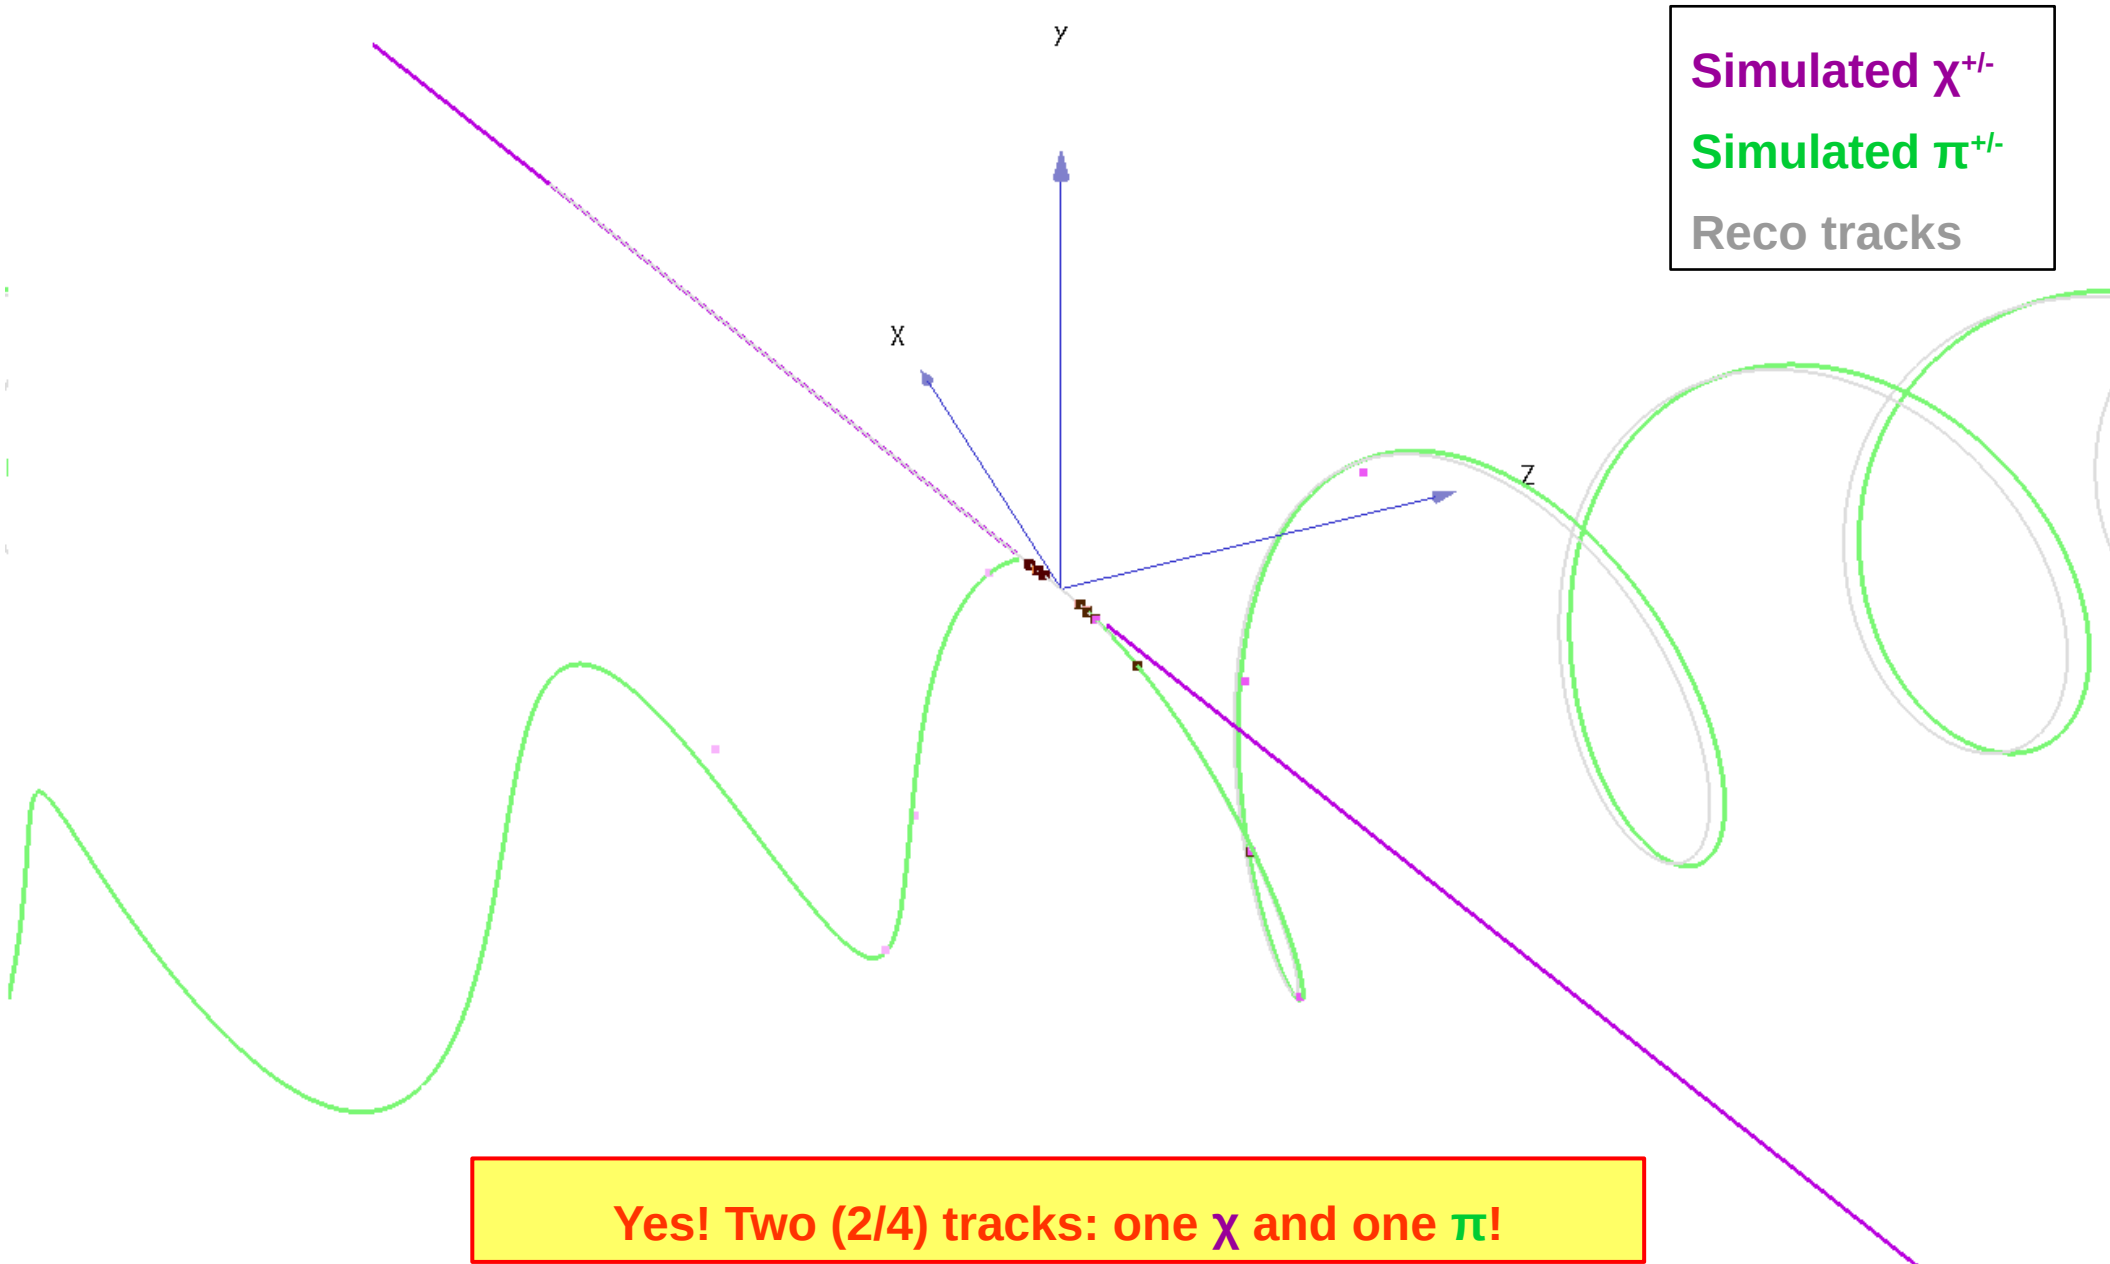

# One event

**Yes! Two (2/4) tracks!**

# One event

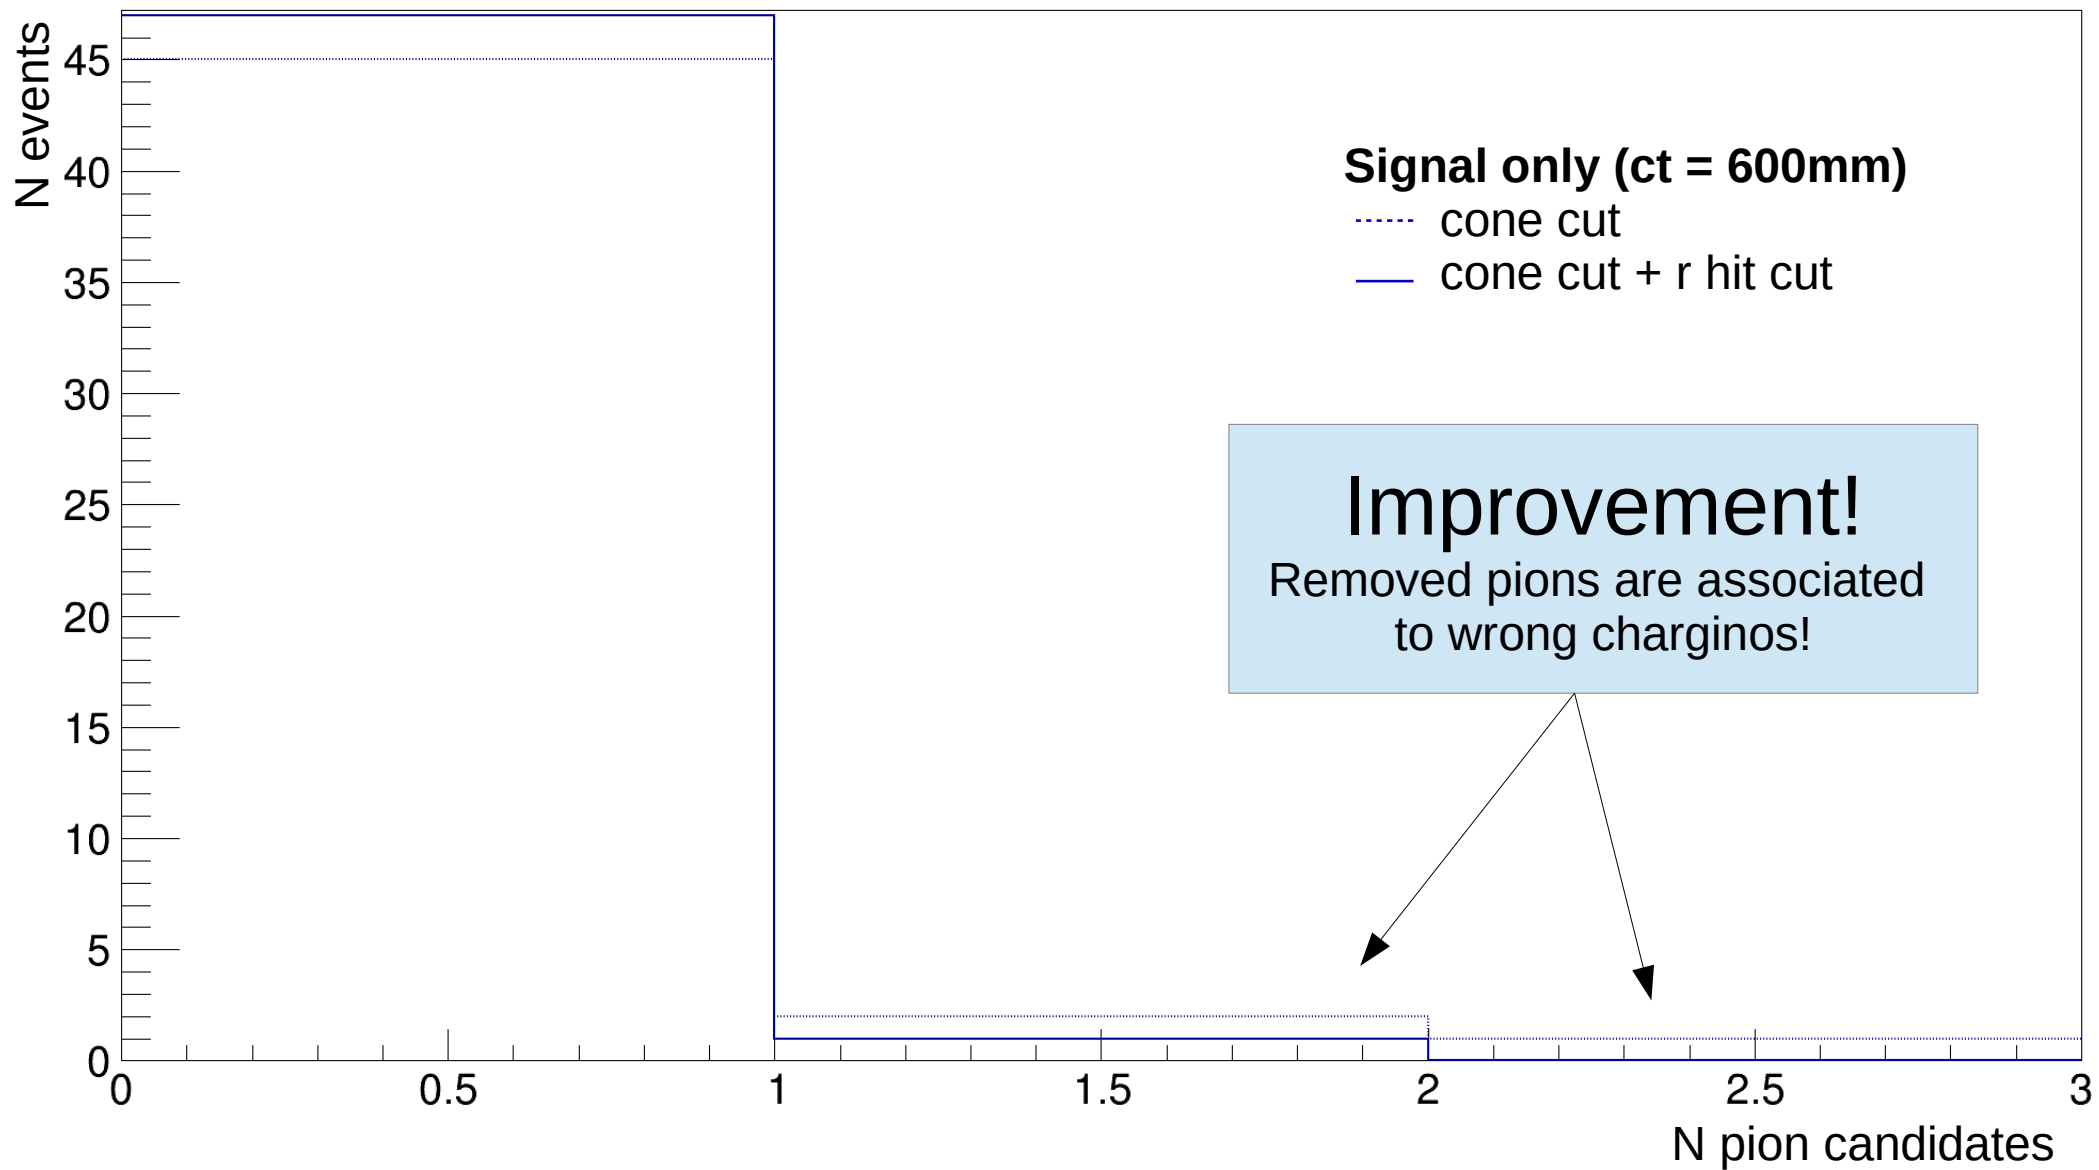

1. Establish chargino candidates (ch1 and ch2 w/ highest reco pT)
2. If n chargino candidate  $\geq 1$  :
  1. Run on the track collection and compute **distance in theta/phi** w.r.t. ch1 and ch2
  2. Assign track to either ch1 or ch2 (min distance)
  3. If distance  $> 1.0$ : skip the track
  4. Check on **hit position in r**:
    - r-coord of pion first hit must be  $>$  r-coord of chargino's last hit

# #pion candidates

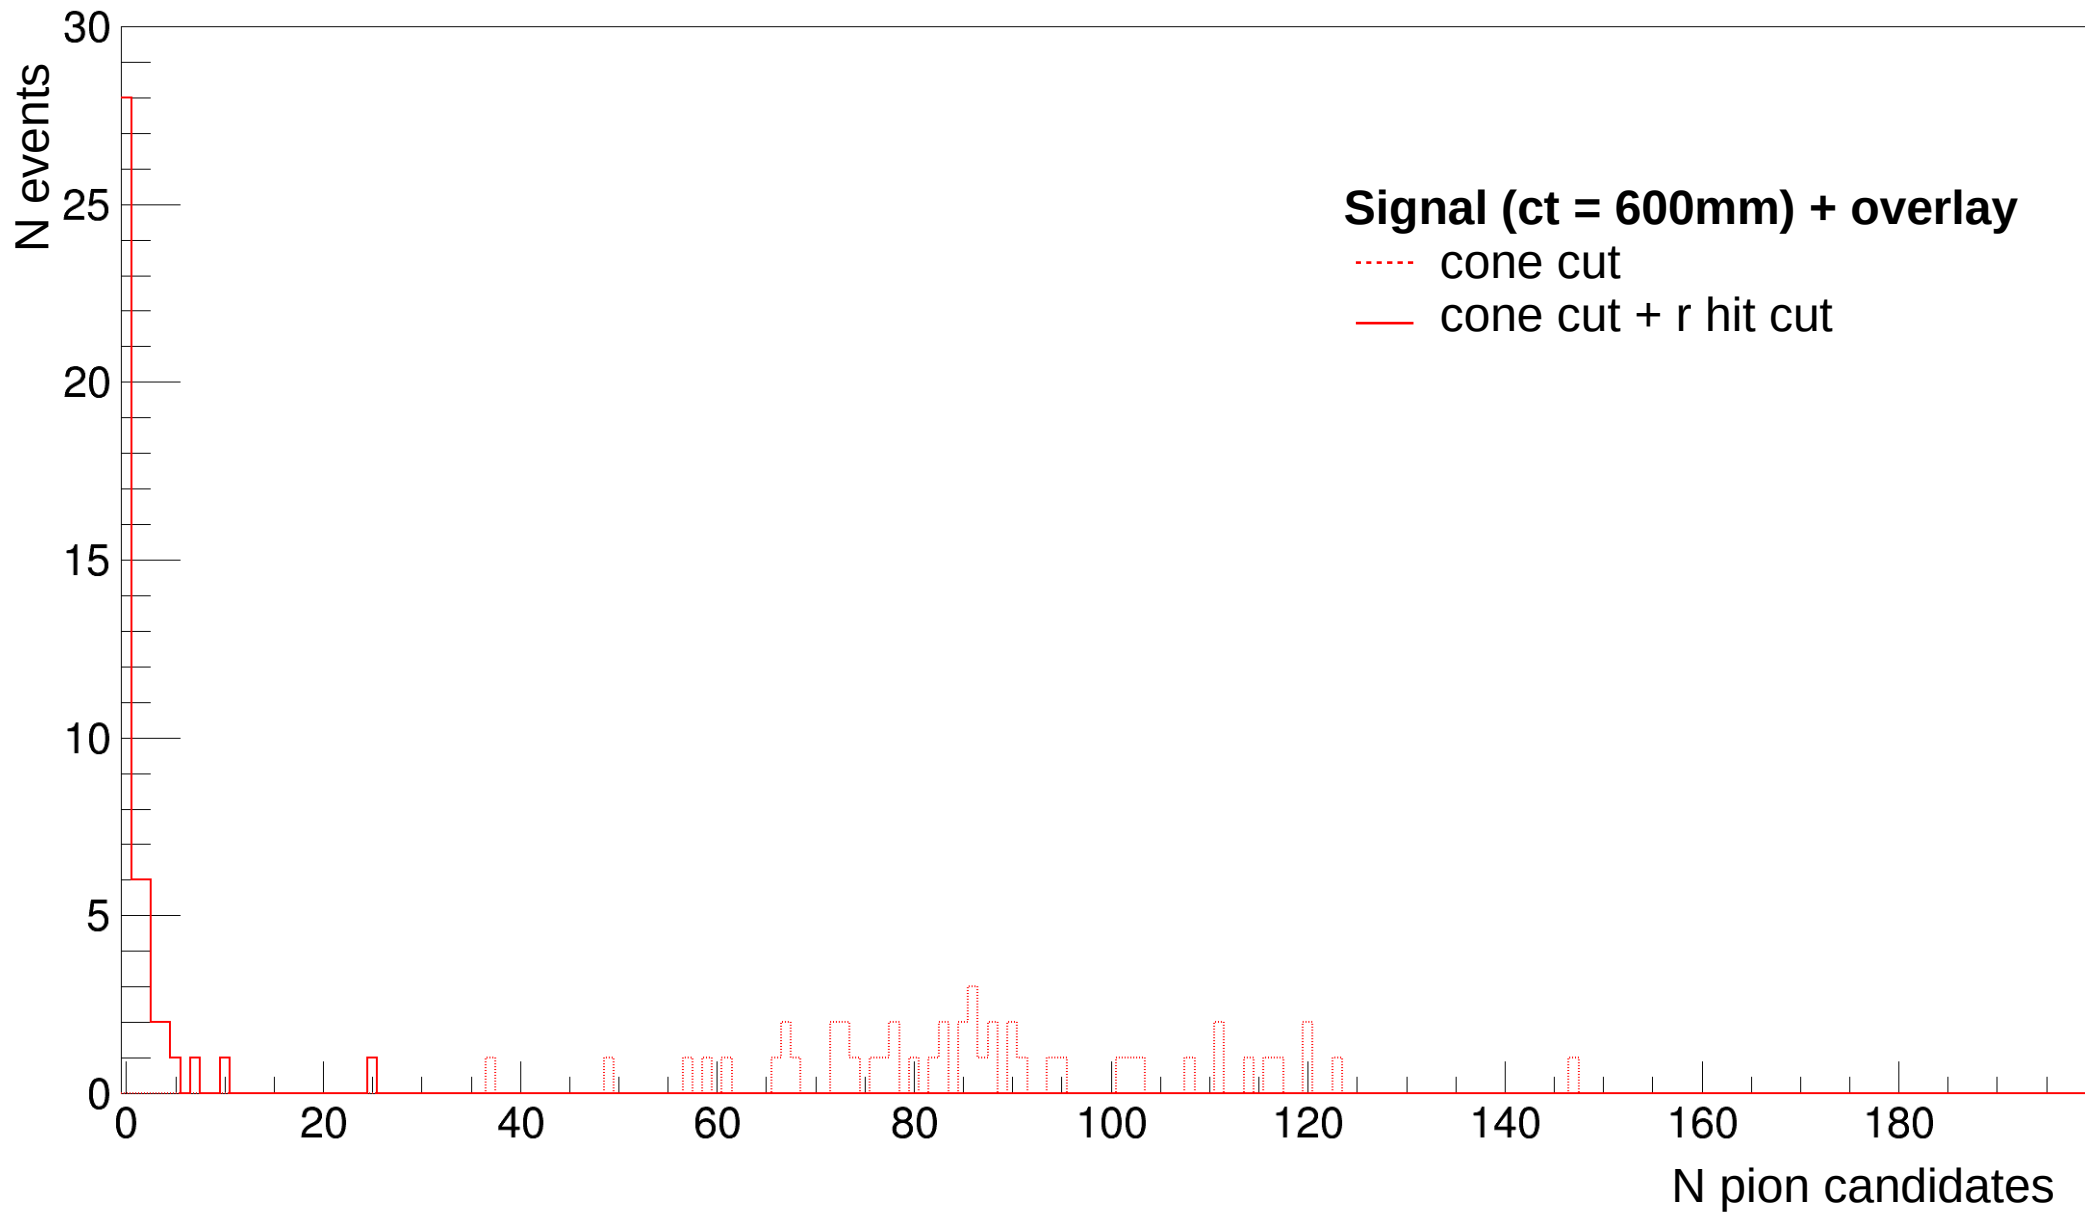

- Test on 48 events (2 files)

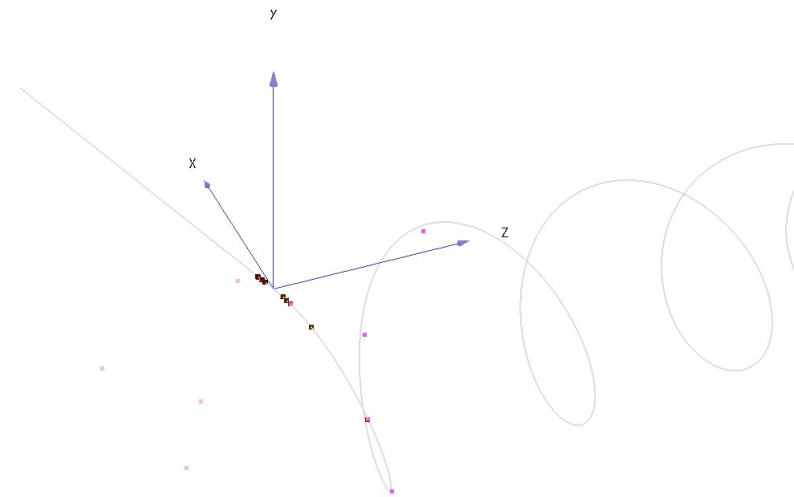

# #pion candidates

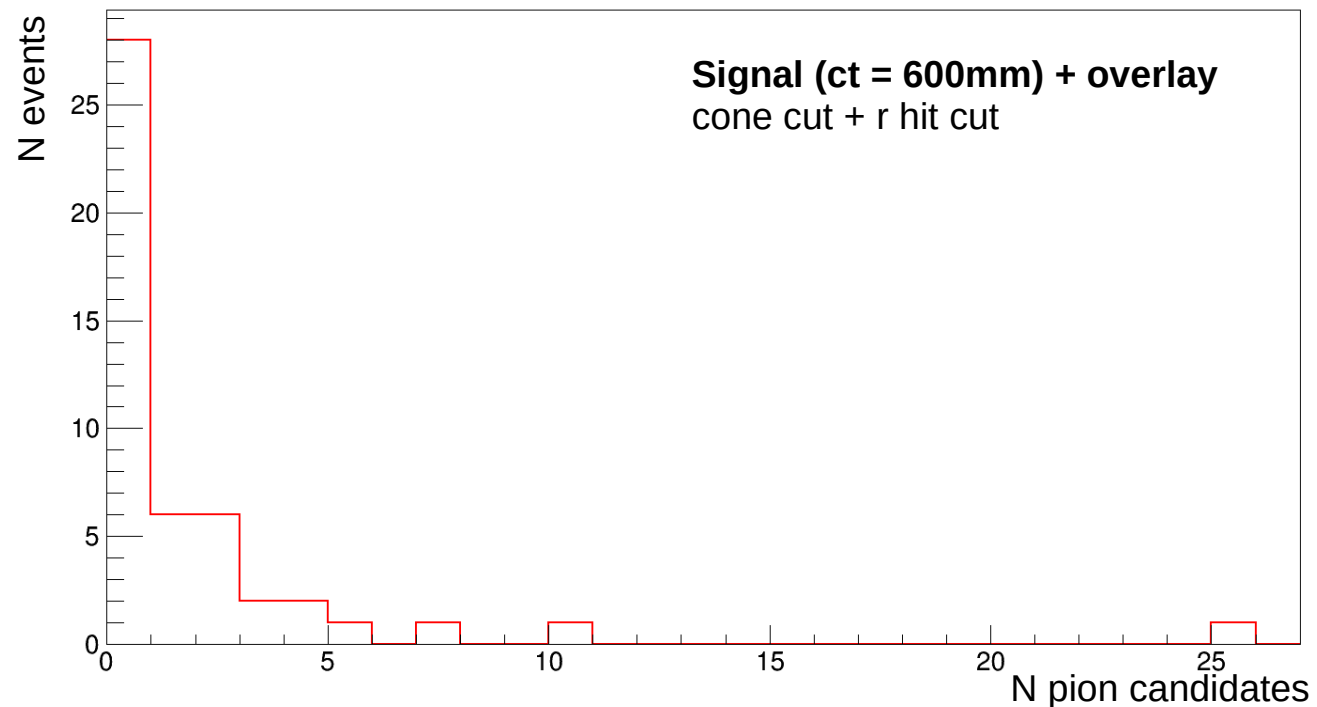

- Test on 48 events

- **Debug info and pion variables in TTree are in place**
- **Looking at the sig only:**  
In most of the events longer chargino are reconstructed  
In most of the events “prompter” pions are reconstructed  
(coming from shorter charginos!)  
→ not easy to find events with both!

- **Looking at the sig+ove:**  
lots of pions still pass the preselection..  
can we use the pion at all?

Thank you for the attention!
