

Hands-On: The Allpix Squared Silicon Detector Simulation Framework

Simon Spannagel, Paul Schütze

9th Beam Telescope and Test Beams Workshop
8. - 10. February 2021

Scope of this Tutorial

- This tutorial will go step-by-step through setting up and running a simulation with Allpix Squared
- The main focus of the tutorial is the usage of Allpix Squared
 - Defining simple to more complicated simulation flows
 - Looking at what modules are doing and how to look at the output
- The latter part will move towards developing your own modules to provide custom output/functionality

Modality of this Tutorial

- The slides will contain all commands typed on the terminal/show all changes to configuration files
- Following along with your computer is **strongly encouraged!**
- Your options to do so:
 - We provide a Virtual Machine with an Allpix Squared installation
 - It's possible to follow on Ixplus / NAF via a CVMFS installation
 - You can also follow with a local installation, but we do not want to start debugging local Geant4/ROOT6 installations during this session

Installation & Sources

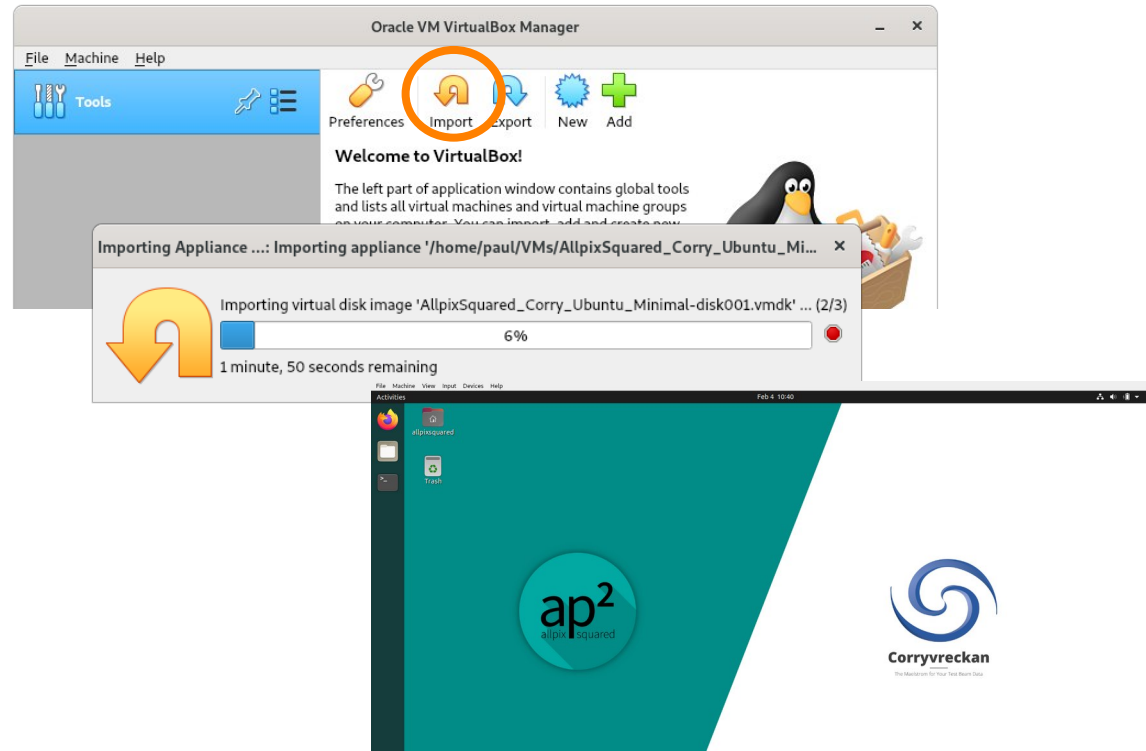

VirtualBox

- For the BTTB tutorials on *Corryvreckan* and *Allpix Squared* we created a Virtual Box
- Virtualisation software: Virtualises a physical machine and lets you run a PC on a PC
- Example:
 - Run a Linux machine as an application within your Windows PC
 - Host allocates configurable amount of memory/CPU/disk space to virtual machine
 - VirtualBox:
 - Free of charge
 - Plenty of useful features

VirtualBox

- Install VirtualBox (via package manager or <https://www.virtualbox.org/wiki/Downloads>)
- Import the downloaded virtual machine
 - Default options are typically fine – adjust if necessary
- Go! (double click on the new virtual box)

CVMFS – CernVM File System

- Central installation of software for CentOS7
- On any machine with CVMFS, simply *source* corresponding script and use the SW
- Many packages available: ROOT, Geant4, LCIO, Delphes, FastJet, ...
... Allpix Squared

CVMFS – CernVM File System

- Using project space of CLICdp at `/cvmfs/clicdp.cern.ch/software/allpix-squared/`
- All versions since v1.1 available
 - Nightly build of master in “latest”
- Each version built for SLC6 and CentOS7:
 - `/1.6.1/x86_64-centos7-gcc10-opt/`
 - `/1.6.1/x86_64-slc6-gcc8-opt/`
- Load all dependencies, C++ libraries & set up \$PATH using setup.sh file:

```

/cvmfs/clicdp.cern.ch/software/allpix-squared% █
```

```
$ source /cvmfs/clicdp.cern.ch/software/allpix-squared/1.6.1/x86_64-centos7-gcc10-opt/setup.sh
$ allpix --version
Allpix Squared version v1.6.1
built on 2021-01-28, 17:30:48 UTC
```

Compiling from Source I

- Satisfy **dependencies** first!
- Hard dependency:
 - ROOT6 - objects, object history, storing/reading from/to files
- Soft dependencies:
 - Geant4 - particle interaction with matter & tracking (*charge deposition*)
 - Eigen - library for fast algebra, used by some modules (*charge propagation*)
- With access to CVMFS (as on LXPLUS / NAF), all is ready, simply do ...

```
$ source etc/scripts/setup_lxplus.sh
```

Compiling from Source II

- Get the **code!**
- A reminder: all resources are linked to from the project page:
<https://cern.ch/allpix-squared/>
- First of all, check out the Allpix-squared repository into a local directory “allpix-squared”
- Move to this directory, and source the setup script for lxplus

```
$ git clone https://gitlab.cern.ch/allpix-squared/allpix-squared.git allpix-squared  
$ cd allpix-squared
```

Compiling from Source III

- We use **CMake** to configure the build
 - Cross-platform, same scripts on Linux & Mac OS
 - Weird-to-write but fairly easy to use/run
- Prefer out-of-source builds: make new folder to compile in

```
$ cmake /path/to/allpix-squared/
```

- Options can be set using “-D...=...” e.g.

```
$ cmake -DBUILD_VisualizationGeant4=OFF /path/to/allpix-squared/
```

- Graphical/ncurses tools can aid in configuration, try:

```
$ ccmake /path/to/allpix-squared/
```

Compiling from Source IV

- Now we can **build** it!

```
$ make -j16  
$ make install
```

- Grab an espresso (but hurry up!)
- Run simulations!

A Note on Visualisation

- We currently use the Qt visualization viewer by Geant4
- Requires the Geant4 version used to be built with options

```
$ cmake -DGEANT4_USE_QT=ON  
-DGEANT4_USE_OPENGL_X11=ON
```

enabled

- Unfortunately currently not available on CVMFS installation of Geant4
 - Working on resolving this issue

Knock, knock – Who's there?

CMakeLists.txt	Instructions for cmake to prepare Allpix Squared compilation
CONTRIBUTING.md	A guide to developers for contributing code
LICENSE.md	The Allpix Squared licence (open source, MIT)
README.md	Instructions for getting started, installation locations, authors
3rdparty/	Included & required 3 rd party software
cmake/	Macros for cmake, formatting tools to make code style consistent
doc/	Documentation including user manual (alternatively see website)
etc/	Selection of things like scripts for making new modules (see later), unit tests, etc
examples/	Documented examples, useful for setting up new simulations
models/	Detector models which can be included in geometry
src/	The main directory for c++ code, including the core software and all modules
tools/	External tools, for example to convert TCAD output, bundled with the framework

Simulation Modules

```
~/software/allpix-squared/src/modules $ ls
CapacitiveTransfer      DepositionPointCharge  GeometryBuilderGeant4  ROOTObjectReader
CMakeLists.txt         DepositionReader       InducedTransfer        ROOTObjectWriter
CorryvreckanWriter     DetectorHistogrammer   LCIOWriter            SimpleTransfer
CSADigitizer           Dummy                  MagneticFieldReader    TextWriter
DatabaseWriter         ElectricFieldReader    ProjectionPropagation  TransientPropagation
DefaultDigitizer       GDMLOutputWriter      PulseTransfer          VisualizationGeant4
DepositionGeant4      GenericPropagation     RCEWriter             WeightingPotentialReader
```

- Most important for today:
 - GeometryBuilderGeant4 – Builds the geometry for Geant4 from configuration
 - DepositionGeant4 – Uses Geant4 for particle propagation and energy deposition
 - GenericPropagation – Propagates charge carriers through the sensor volume
 - DefaultDigitizer – Describes the digitization in front end electronics
 - DetectorHistogrammer – Creates useful histograms for detector characterisation

Getting Started

Your first Simulation – The Configuration

- Let's create a new configuration file: **tutorial-simulation.conf**
 - Hint: I usually create a new directory for a new simulation, either outside the source directory or in *conf/*
- Syntax:
 - **[Section]** – This can be global parameters ([Allpix]) or a *module*
 - **key = value** – Key-value pairs that belong to the last mentioned section
 - Many different types can be input via the config files - strings, integers, doubles, vectors/arrays, etc
- Global parameters are always required
 - Number of events
 - Geometry file

```
1 [Allpix]
2 number_of_events = 1000
3 detectors_file = "tutorial-geometry.conf"
```

Your first Simulation – The Geometry

- The second required file is a geometry description
- Let's create **tutorial-geometry.conf**
- The geometry configuration file determines which detector is used
 - Each detector is given a unique name (*detector1* here) and placed in the global coordinate system at a certain position with a given rotation
- Looking in the models folder the list of currently known detectors can be seen
 - A new detector model can be built, or an existing detector used
 - For this example, we will pick the **timepix** model

```
1 [detector1]
2 type = "timepix"
3 position = 0mm 0mm 0mm
4 orientation = 0 0 0
```

```
~/software/allpix-squared/models $ ls
alpine.conf
alpine_excess.conf
alpine_no_support.conf
alpine_no_support_rot.conf
clicpix2.conf
clicpix.conf
CMakeLists.txt
cmsp1.conf
diode.conf
fei3.conf
ibl_planar.conf
medipix3.conf
mimosa23.conf
mimosa26.conf
mimosa26_no_support.conf
test.conf
timepix.conf
~/software/allpix-squared/models $
```

The Model: timepix.conf

```

1 type = "hybrid"
2
3 number_of_pixels = 256 256
4 pixel_size = 55um 55um
5
6 sensor_thickness = 300um
7 sensor_excess = 1mm
8
9 bump_sphere_radius = 9.0um
10 bump_cylinder_radius = 7.0um
11 bump_height = 20.0um
12
13 chip_thickness = 700um
14 chip_excess_left = 15um
15 chip_excess_right = 15um
16 chip_excess_bottom = 2040um
17
18 [support]
19 thickness = 1.76mm
20 size = 47mm 79mm
21 offset = 0 -22.25mm

```

Adding Physics

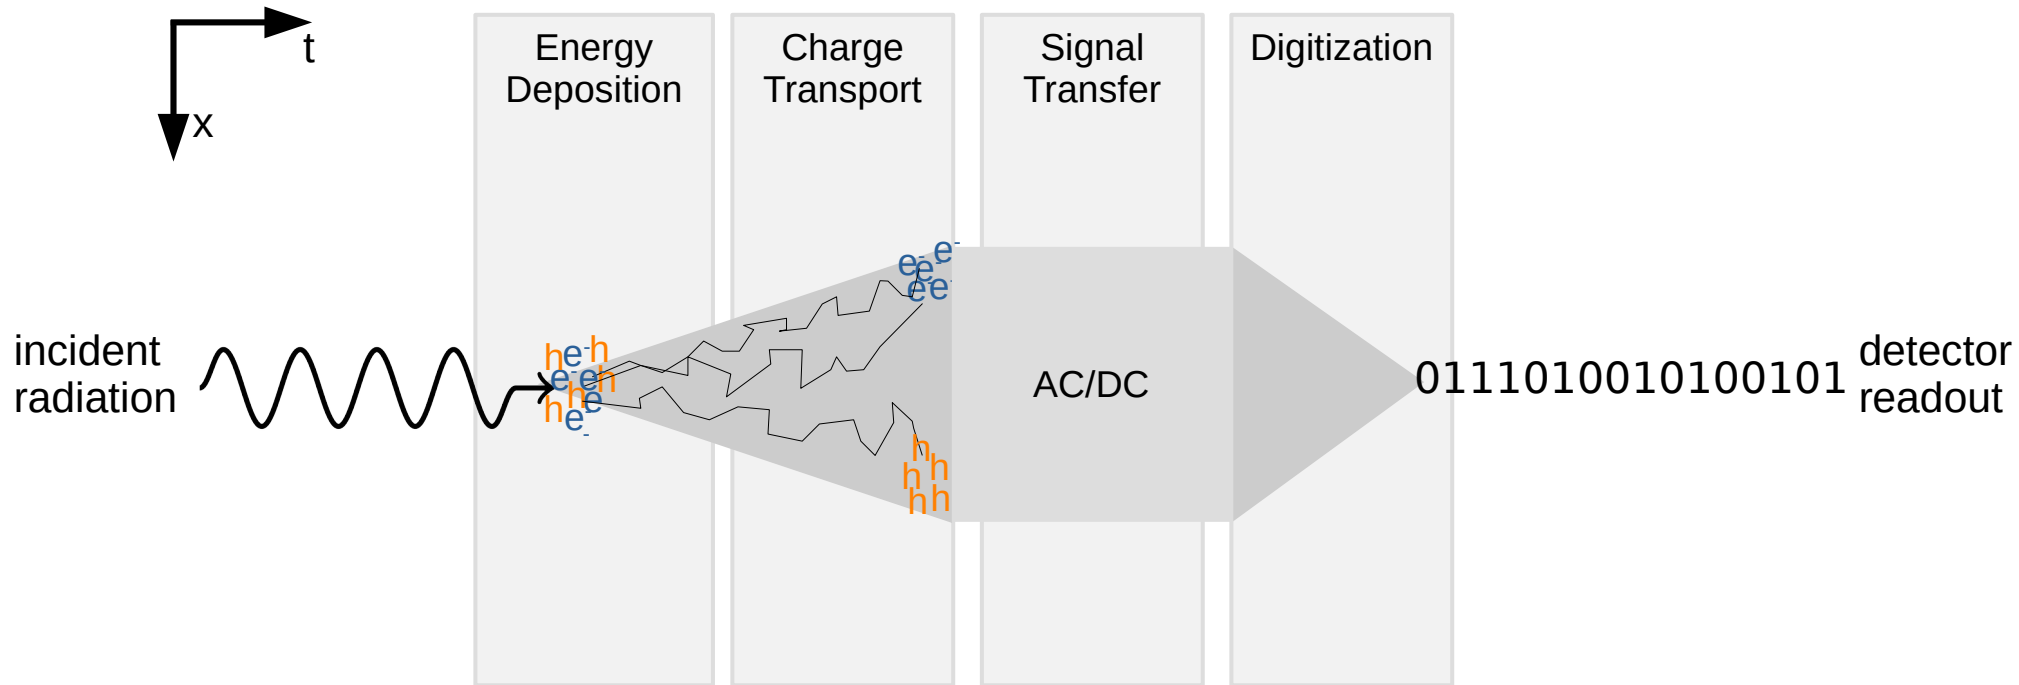

- We now have a simulation setup that doesn't do anything

```
$ ../bin/allpix -c tutorial-simulation.conf
```

- We can now start to add algorithms, or *modules*
 - Simply done by including a **[section]** in the main configuration file
 - Parameters for each algorithm are added within the corresponding section block

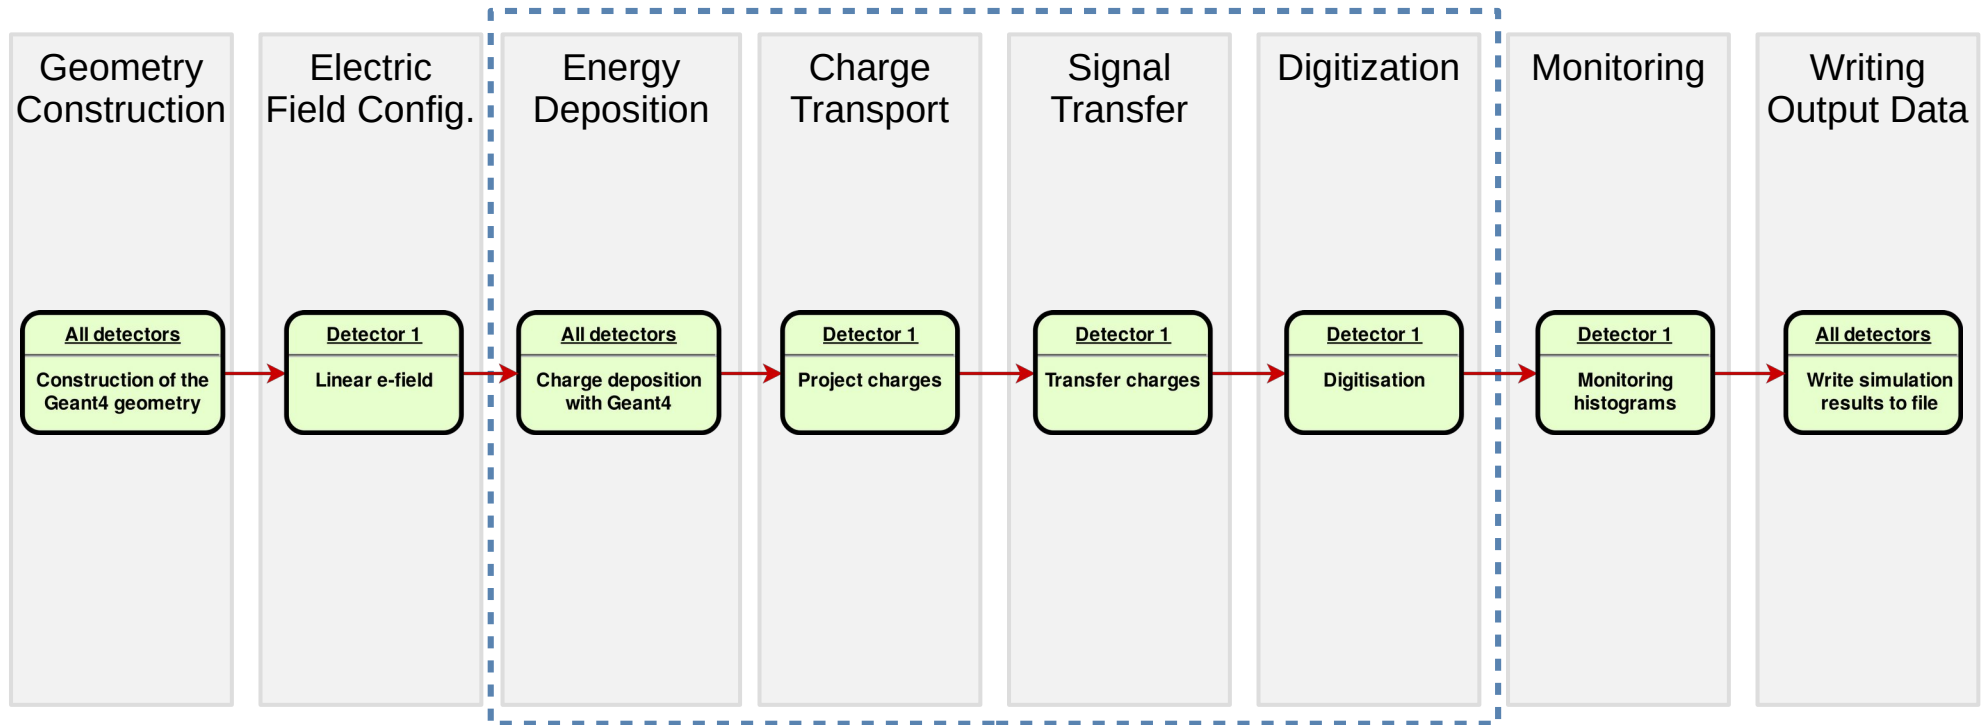

Adding Physics

- Most simulations involve the same concepts ...

Adding Physics

- Allpix Squared: one *module* for each *task*

Your second Simulation

- Edit the **tutorial-simulation.conf** to include further modules
- This won't run yet as not all parameters have default values ...

```

1 [Allpix]
2 number_of_events = 1000
3 detectors_file = "tutorial-geometry.conf"
4
5 [GeometryBuilderGeant4]
6
7 [DepositionGeant4]
8
9 [ElectricFieldReader]
10
11 [ProjectionPropagation]
12
13 [SimpleTransfer]
14
15 [DefaultDigitizer]
16
17 [DetectorHistogrammer]

```

Module Parameters

- All modules are thoroughly described in the user manual

<https://cern.ch/allpix-squared/usermanual/allpix-manualch7.html>

- List of available parameters for corresponding module with default values
- Usage examples

Description

Converts all object data stored in the ROOT data file produced by the ROOTObjectWriter module back into messages (see the description of ROOTObjectWriter for more information about the format). Reads all trees defined in the data file that contain Allpix objects. Creates a message from the objects in the tree for every event.

If the requested number of events for the run is less than the number of events the data file contains, all additional events in the file are skipped. If more events than available are requested, a warning is displayed and the other events of the run are skipped.

Currently it is not yet possible to exclude objects from being read. In case not all objects should be converted to messages, these objects need to be removed from the file before the simulation is started.

Parameters

- `file_name` : Location of the ROOT file containing the trees with the object data. The file extension `.root` will be appended if not present.
- `include` : Array of object names (without `allpix::` prefix) to be read from the ROOT trees, all other object names are ignored (cannot be used simultaneously with the `exclude` parameter).
- `exclude` : Array of object names (without `allpix::` prefix) not to be read from the ROOT trees (cannot be used simultaneously with the `include` parameter).
- `ignore_seed_mismatch` : If set to true, a mismatch between the core random seed in the configuration file and the input data is ignored, otherwise an exception is thrown. This also covers the case when the core random seed in the configuration file is missing. Default is set to false.

Usage

This module should be placed at the beginning of the main configuration. An example to read only PixelCharge and PixelHit objects from the file `data.root` is:

```
[ROOTObjectReader]
file_name = "data.root"
include = "PixelCharge", "PixelHit"
```

The World

- **GeometryBuilderGeant4**
- Translates and defines the geometry to Geant4
- No required parameters
 - By default the setup is placed in air

[GeometryBuilderGeant4]

The Particles

- **DepositionGeant4**
- Interface to Geant4
- Definition of particles and tracking through the setup
 - Energy deposition in sensitive material
- Pick ...
 - the type of particles
 - the particle energy
 - the origin and direction of the beam
 - the shape and size of the beam
 - a suitable physics list

```
[DepositionGeant4]
particle_type = "e-"
source_energy = 5GeV
source_type = "beam"
beam_size = 3mm
source_position = 0 0 -200mm
beam_direction = 0 0 1
physics_list = FTFP_BERT_EMZ
```

Don't forget the units!

The Electric Field

- **ElectricFieldReader**
- Generation of an electric field in the sensor
- A *Linear* field is the simplest approximation, using a user-defined depletion and bias voltage
 - Higher bias voltages increase the electric field
 - No focussing effects around the implants
- More realistic fields can be added by converting the output of e.g. TCAD simulations

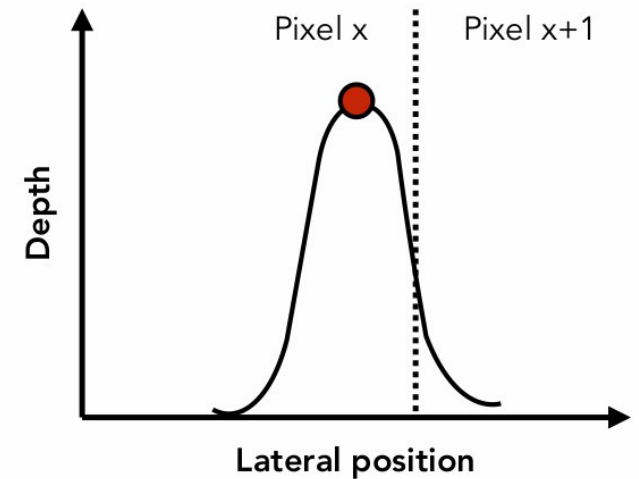

```
[ElectricFieldReader]  
model = "linear"  
bias_voltage = -50V  
depletion_voltage = -30V
```

The Propagation

- **ProjectionPropagation**
- Relatively simple technique to propagate deposited charges towards the electrodes
- Charges are projected to the sensor surface in discrete groups
 - Drift time is approximated using the linear electric field profile and the initial position
 - Diffusion depending on the drift time added as gaussian smearing of charges on the sensor surface
 - Charges in eventual non-depleted regions can diffuse into the electric field prior to the projection

```
[ProjectionPropagation]
temperature = 293K
charge_per_step = 10
```

The Transfer

- Not all propagated charge carriers will necessarily end up on the collection implant due to ...
 - Low-field regions
 - Linear field approximation
- Transferring the charge from the sensor to the input of the electronics
- **SimpleTransfer**
- In this approximation, all charges within x microns to the implant are considered as collected (default: 5 μm)

[SimpleTransfer]

The Digitisation

- Many front-end chips feature similar kinds of effects
 - Gaussian noise on the collected charge
 - A threshold level
 - A QDC with a certain gain
- **DefaultDigitizer**
- Implementation of above features plus ...
 - Threshold dispersion
 - QDC smearing
 - TDC / ToA / ToT calculation if pulses are simulated

[DefaultDigitizer]

The Histogrammer

- **DetectorHistogrammer**
- Creation of typical detector performance plots including a simple clustering technique and comparison the Monte Carlo truth, like ... [DetectorHistogrammer]
 - Hit map
 - Pixel & cluster charge distribution
 - Cluster size
 - Efficiency (vs MC truth)
 - Residuals (vs MC truth)
- These plots can give a good and quick overview over the detector performance, *but they do not replace a thorough analysis*

Updated Configuration

- Now we have a simulation setup that will shoot 5 GeV electrons at a *timepix* detector, *project* the charges to the surface based on a *linear field approximation* and *digitises* the collected charges
- Two hints before we start ...
 - The **log_level** flag changes the detail (and quantity) of information output by modules (global and/or module parameter)
 - The **output_plots** flag can be set individually for modules to get additional plots
- Run the simulation ...

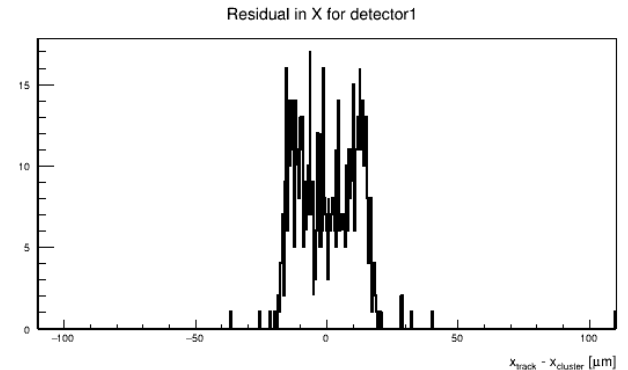

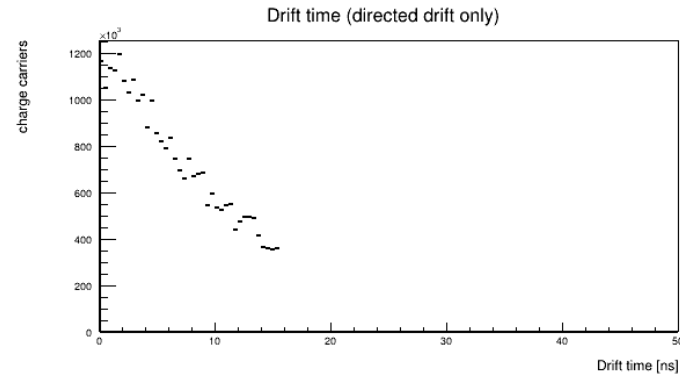

```
$ ../bin/allpix -c tutorial-simulation.conf
```

```
1 [Allpix]
2 number_of_events = 1000
3 detectors_file = "tutorial-geometry.conf"
4 log_level = "WARNING"
5
6 [GeometryBuilderGeant4]
7
8 [DepositionGeant4]
9 particle_type = "e-"
10 source_energy = 5GeV
11 source_type = "beam"
12 beam_size = 3mm
13 source_position = 0 0 -200mm
14 beam_direction = 0 0 1
15 physics_list = FTFP_BERT_EMZ
16 output_plots = 1
17
18 [ElectricFieldReader]
19 model = "linear"
20 bias_voltage = -50V
21 depletion_voltage = -30V
22 output_plots = 1
23
24 [ProjectionPropagation]
25 temperature = 293K
26 charge_per_step = 10
27 output_plots = 1
28
29 [SimpleTransfer]
30 output_plots = 1
31
32 [DefaultDigitizer]
33 output_plots = 1
34
35 [DetectorHistogrammer]
```

Plots, plots, plots ...

- The output is (if not configured otherwise) located in *output/modules.root*
- Let's have a look ...

```
$ root -l output/modules.root
```

Adding Precision

- There are many spots to add precision or to gain deeper information on the detector behaviour
- Example:
 - Use **GenericPropagation** instead of *ProjectionPropagation*
 - Enable *output_linegraphs* for a visualisation of the charge carrier motion (animation also possible)
 - Performance penalty
- Or use **TransientPropagation** to create charge pulses and simulate a charge sensitive amplifier afterwards ...

```
[GenericPropagation]  
temperature = 293K  
charge_per_step = 10  
output_plots = 1  
output_linegraphs = 1
```

Adding Detectors

- Similar to the single detector geometry, subsequent detectors can be added
 - Avoid overlaps between detectors/materials
- Here: Let's simulate a timepix telescope with a spacing of 20 mm in z
- For more complex geometries, a visualisation of the setup using the Geant4 visualisation tools is extremely useful `[VisualizationGeant4]`
 - Unfortunately these do not run on Ixplus – tools not included in the default CVMFS installation

```
1 [detector1]
2 type = "timepix"
3 position = 0mm 0mm 0mm
4 orientation = 0 0 0
5
6 [detector2]
7 type = "timepix"
8 position = 0mm 0mm 20mm
9 orientation = 0 0 0
10
11 [detector3]
12 type = "timepix"
13 position = 0mm 0mm 40mm
14 orientation = 0 0 0
15
16 [detector4]
17 type = "timepix"
18 position = 0mm 0mm 60mm
19 orientation = 0 0 0
20
21 [detector5]
22 type = "timepix"
23 position = 0mm 0mm 80mm
24 orientation = 0 0 0
25
26 [detector6]
27 type = "timepix"
28 position = 0mm 0mm 100mm
29 orientation = 0 0 0
```

Visualising the Setup

Treating Detectors in Different Ways

- When we added more detectors to the geometry file, everything was taken care of under the hood
- What is happening in the background?
 - One instance of a module is created per detector
 - This allows e.g. to use multi-threading, running the same module for different detectors in parallel
- Background information: modules can be either **unique** or specific to one **detector**
- What if we would like to use different parameters for different detectors, though?

A Single Detector Simulation Chain

GeometryBuilderGeant4

DepositionGeant4

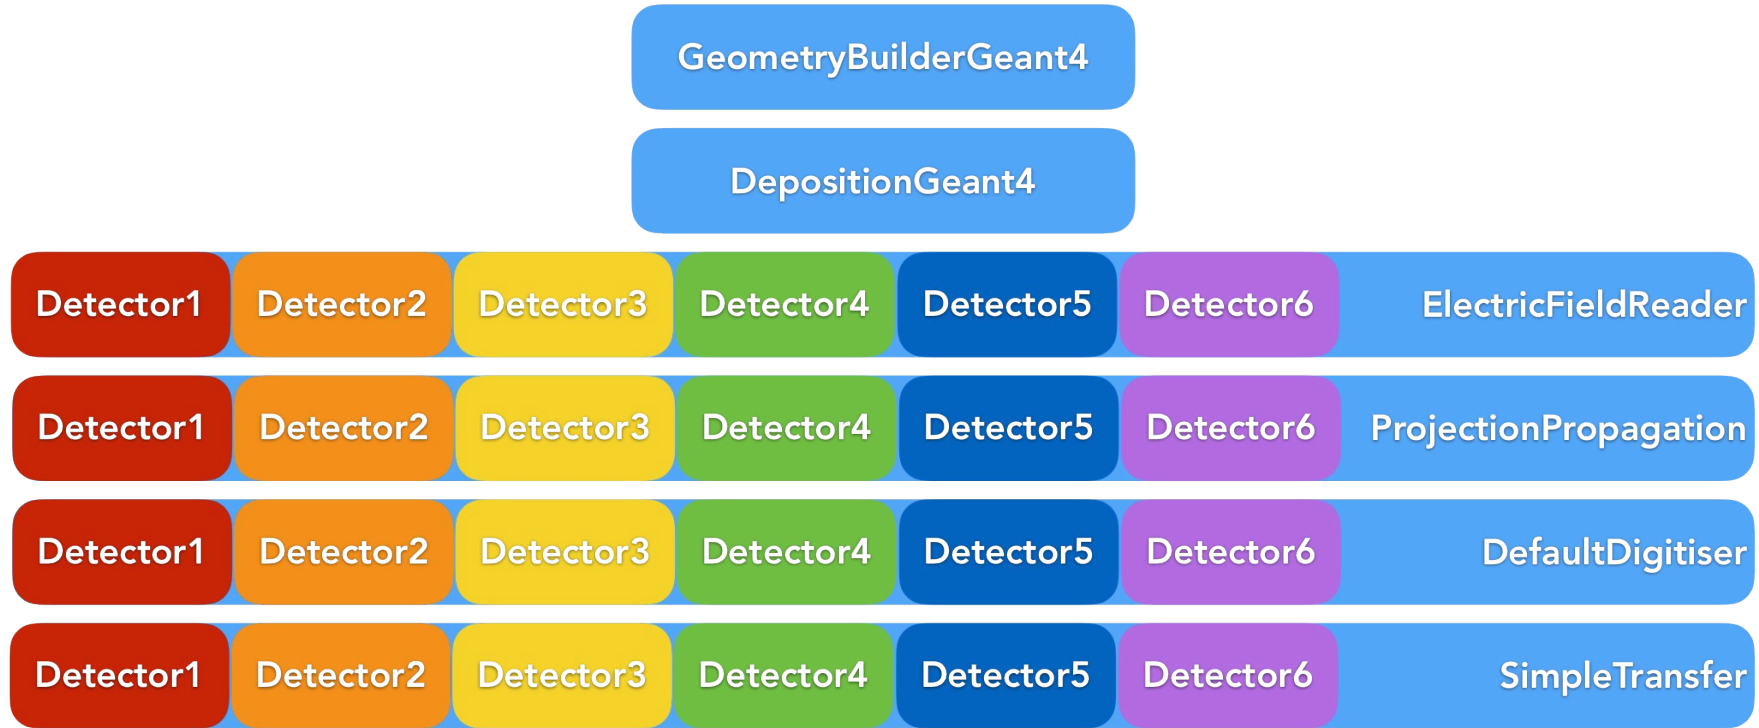

ElectricFieldReader

ProjectionPropagation

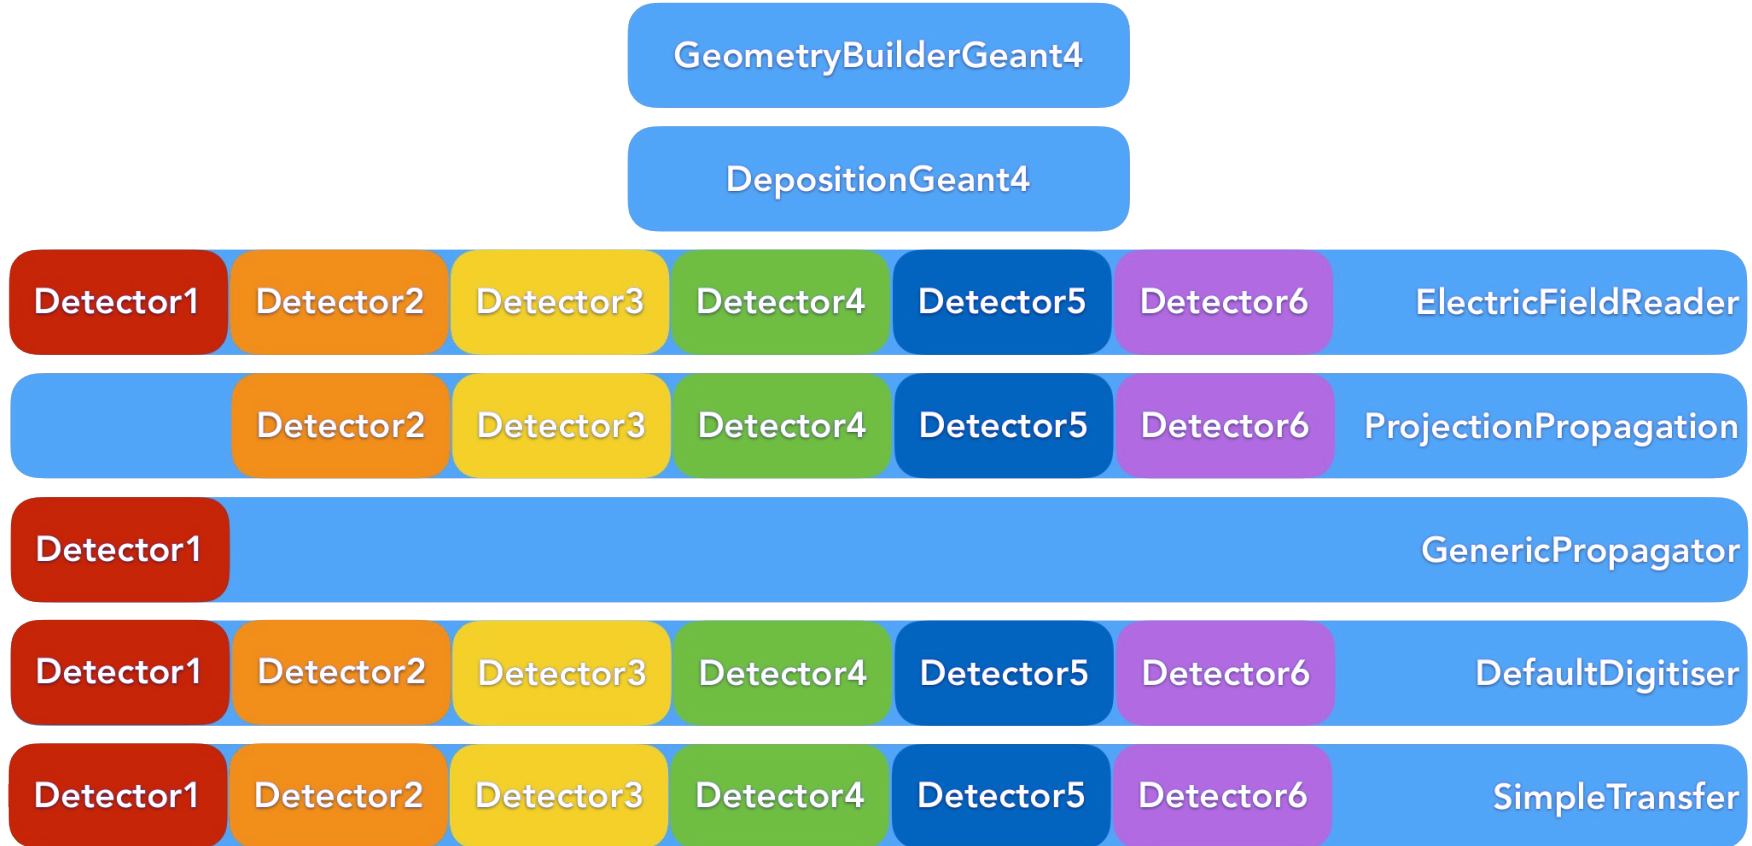

DefaultDigitiser

SimpleTransfer

A Multi-Detector Simulation Chain

Now what if I ... ?

Split Module Configurations

- By default, all instances of a module will apply to all detectors
- We can overwrite this by specifying either the *name* or the *type* of the detectors
- Make a module operate **on one detector only** or on a subset of detectors

Default electric field configuration

```
[ElectricFieldReader]
model = "linear"
bias_voltage = -50V
depletion_voltage = -30V
```

Overwritten for *detector1*

```
[ElectricFieldReader]
name = "detector1"
model = "linear"
bias_voltage = -100V
depletion_voltage = -30V
```

Works great on Telescope + DUT simulations!

Split Module Configurations

- By default, all instances of a module will apply to all detectors
- We can overwrite this by specifying either the *name* or the *type* of the detectors
- Make a module operate on one detector only or **on a subset of detectors**

Subset given as list of detectors	<pre>[ProjectionPropagation] name = "detector2", "detector3", "detector4", "detector5", "detector6" temperature = 293K charge_per_step = 10</pre>
Specific for <i>detector1</i>	<pre>[GenericPropagation] name = "detector1" temperature = 293K charge_per_step = 10</pre>

Updated Simulation Configuration

```

1 [Allpix]
2 number_of_events = 1000
3 detectors_file = "tutorial-geometry.conf"
4 log_level = "WARNING"
5
6 [GeometryBuilderGeant4]
7
8 [DepositionGeant4]
9 particle_type = "e-"
10 source_energy = 5GeV
11 source_type = "beam"
12 beam_size = 3mm
13 source_position = 0 0 -200mm
14 beam_direction = 0 0 1
15 physics_list = FTFP_BERT_EMZ
16 output_plots = 1
17
18 [ElectricFieldReader]
19 model = "linear"
20 bias_voltage = -50V
21 depletion_voltage = -30V
22 output_plots = 1
23
24 [ElectricFieldReader]
25 name = "detector1"
26 model = "linear"
27 bias_voltage = -100V
28 depletion_voltage = -30V
29 output_plots = 1
30
31 [ProjectionPropagation]
32 name = "detector2", "detector3", "detector4", "detector5", "detector6"
33 temperature = 293K
34 charge_per_step = 10
35 output_plots = 1
36
37 [GenericPropagation]
38 name = "detector1"
39 temperature = 293K
40 charge_per_step = 10
41 output_plots = 1
42
43 [SimpleTransfer]
44 output_plots = 1
45
46 [DefaultDigitizer]
47 output_plots = 1
48
49 [DetectorHistogrammer]

```

Simulation Replays

- Imagine:
“I would like to perform a threshold scan for my detector, but running the full chain 20 times is just time consuming...”
- In each simulation step, *objects* are generated: *MCParticle*, *DepositedCharge*, *PropagatedCharge*, *PixelHit*, ...
- The modules *RootObjectWriter* and *-Reader* store and read these objects
 - This allows to pick up on your simulation at a later point in time

Simulation Replays

```

1 [detector1]
2 type = "timepix"
3 position = 0mm 0mm 0mm
4 orientation = 0 0 0

```

```

1 [Allpix]
2 number_of_events = 1000
3 detectors_file = "tutorial-geometry.conf"
4 log_level = "WARNING"
5 random_seed_core = 1234
6
7 [GeometryBuilderGeant4]
8
9 [DepositionGeant4]
10 particle_type = "e-"
11 source_energy = 5GeV
12 source_type = "beam"
13 beam_size = 3mm
14 source_position = 0 0 -200mm
15 beam_direction = 0 0 1
16 physics_list = FTFP_BERT_EMZ
17 output_plots = 1
18
19 [ElectricFieldReader]
20 model = "linear"
21 bias_voltage = -50V
22 depletion_voltage = -30V
23 output_plots = 1
24
25 [GenericPropagation]
26 name = "detector1"
27 temperature = 293K
28 charge_per_step = 10
29 output_plots = 1
30
31 [SimpleTransfer]
32 output_plots = 1
33
34 [ROOTObjectWriter]
35 file_name = "prepared_data.root"
36 include = "MCParticle", "PixelCharge"

```

```

1 [Allpix]
2 number_of_events = 1000
3 detectors_file = "tutorial-geometry.conf"
4 log_level = "WARNING"
5 random_seed_core = 1234
6
7 [ROOTObjectReader]
8 file_name = "output/prepared_data.root"
9 include = "MCParticle", "PixelCharge"
10
11 [DefaultDigitizer]
12 threshold = 400e
13 output_plots = 1
14
15 [DetectorHistogrammer]

```

```

11 [DefaultDigitizer]
12 threshold = 800e
13 output_plots = 1

```

```

11 [DefaultDigitizer]
12 threshold = 1200e
13 output_plots = 1

```

Or try ...

```

$ allpix -c tutorial-replay.conf
-o DefaultDigitizer.threshold=1200e

```

Allpix Squared

–

Development

Making your own Module I

- Up to now:
Setting up a simulation and configuring different modules for different detectors
 - No need to touch c++ code yet
- Next step:
Developing a custom module
 - Keep in mind that modules may already be implemented / can be configured in a way that you need
 - Keep in mind that making your new module generic will benefit other users
- Useful script delivered in repository: **make_module.sh**

Making your own Module II

```
~/software/allpix-squared $ ./etc/scripts/make_module.sh

Preparing code basis for a new module:

Name of the module? NewTransfer
Type of the module?

1) unique
2) detector
#? 2

Input message type? PropagatedCharge
Creating directory and files...

Name:    NewTransfer
Author:  Paul Schuetze (paul.schuetze@desy.de)
Path:    /home/paul/software/allpix-squared/src/modules/NewTransfer
This module listens to "PropagatedCharge" messages from one detector

Re-run CMake in order to build your new module.
```

A Word on Messages

- Modules exist entirely standalone in Allpix Squared
 - Information exchange by dispatching and receiving messages via the core of the software
 - Checks which messages each module is waiting for and whether messages being dispatched are subsequently used
- For per-detector modules, separate messages are dispatched for each detector, with the detector name used in the identification
- New modules need to decide what objects to request
 - DepositedCharges, PropagatedCharges, etc.

Making your own Module II

Constructor:
Configuration &
Bind to messages

Initialisation:
Variables / Histograms

Run Loop:
Main code,
executed for each event

```
/**
 * @file
 * @brief Implementation of [NewTransfer] module
 * @copyright Copyright (c) 2017-2020 CERN and the Allpix Squared authors.
 * This software is distributed under the terms of the MIT License, copied verbatim in the file "LICENSE.md".
 * In providing this license, CERN does not waive the privileges and immunities granted to it by virtue of its status as an
 * Intergovernmental Organization or submit itself to any jurisdiction.
 */
```

```
#include "NewTransferModule.hpp"
```

```
#include <string>
#include <utility>
```

```
#include "core/utis/log.h"
```

```
using namespace allpix;
```

```
NewTransferModule::NewTransferModule(Configuration& config, Messenger* messenger,
std::shared_ptr<Detector> detector)
: Module(config, detector), detector_(detector), messenger_(messenger) {

    // ... Implement ... (Typically bounds the required messages and optionally
    // sets configuration defaults)
    // Input required by this module
    messenger_>bindSingle(this, &NewTransferModule::message_, MsgFlags::REQUIRED);
}
```

```
void NewTransferModule::init() {
    // Get the detector name
    std::string detectorName = detector_>getName();
    LOG(DEBUG) << "Detector with name " << detectorName;
}
```

```
void NewTransferModule::run(unsigned int) {
    // ... Implement ... (Typically uses the configuration to execute function and outputs an message)
    std::string detectorName = message_>getDetector()->getName();
    LOG(DEBUG) << "Picked up " << message_>getData().size() << " objects from detector " << detectorName;
}
```

Making your own Module IV

- CMake is set up to compile all modules in the corresponding directory
 - Simply re-run CMake from the build directory and compile

```

$ cd build
$ cmake ..
$ make -j8 install
$ cd ../conf/
$ ../bin/allpix -c tutorial-simulation.conf

```

```
-- Building module ON - NewTransfer
```

```

Scanning dependencies of target AllpixModuleNewTransfer
[ 75%] Building CXX object src/modules/NewTransfer/CMakeFiles/
/__/core/module/dynamic_module_impl.cpp.o
[ 75%] Building CXX object src/modules/MagneticFieldReader/CMA
ieldReader.dir/MagneticFieldReaderModule.cpp.o
[ 75%] Building CXX object src/modules/NewTransfer/CMakeFiles,
ewTransferModule.cpp.o

```

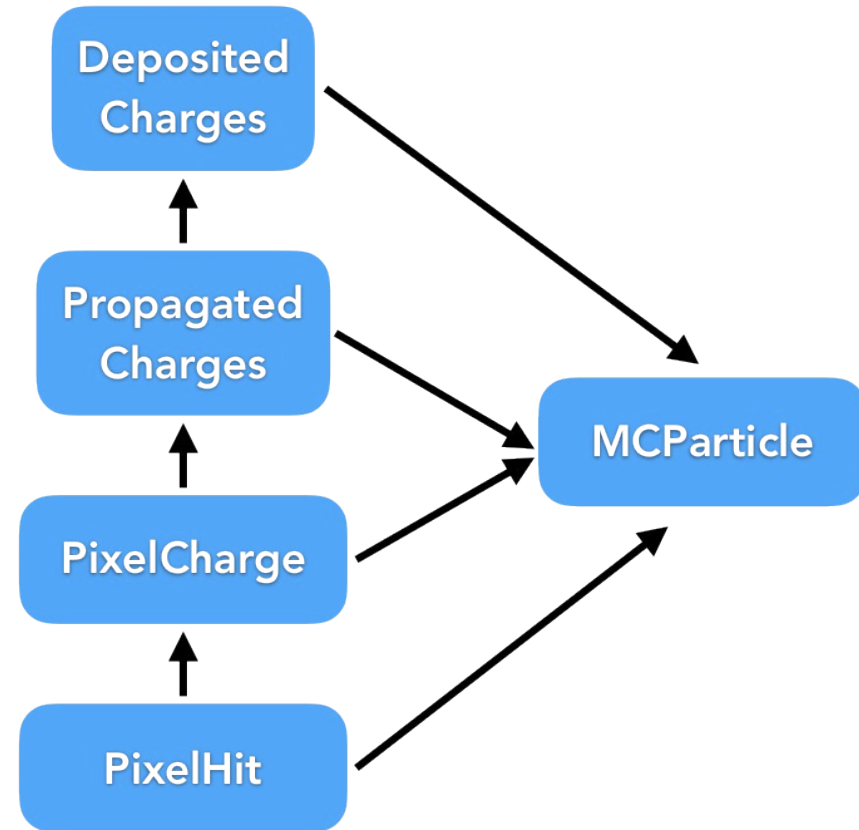

- Module can be added to the simulation configuration in the same way as any other module

31 [NewTransfer]

A few other Features – MC History

- All objects contain information about where they come from
 - Direct link to preceding object
 - All objects link back to original *MCParticle*
- Messages templated in the code, so adding a new object is straight forward
 - Define the object, must inherit from *Object*
 - Add a definition for the message ...

```
/**
 * @brief Typedef for message carrying propagated charges
 */
using PropagatedChargeMessage = Message<PropagatedCharge>;
```

A few other Features – Output Writing

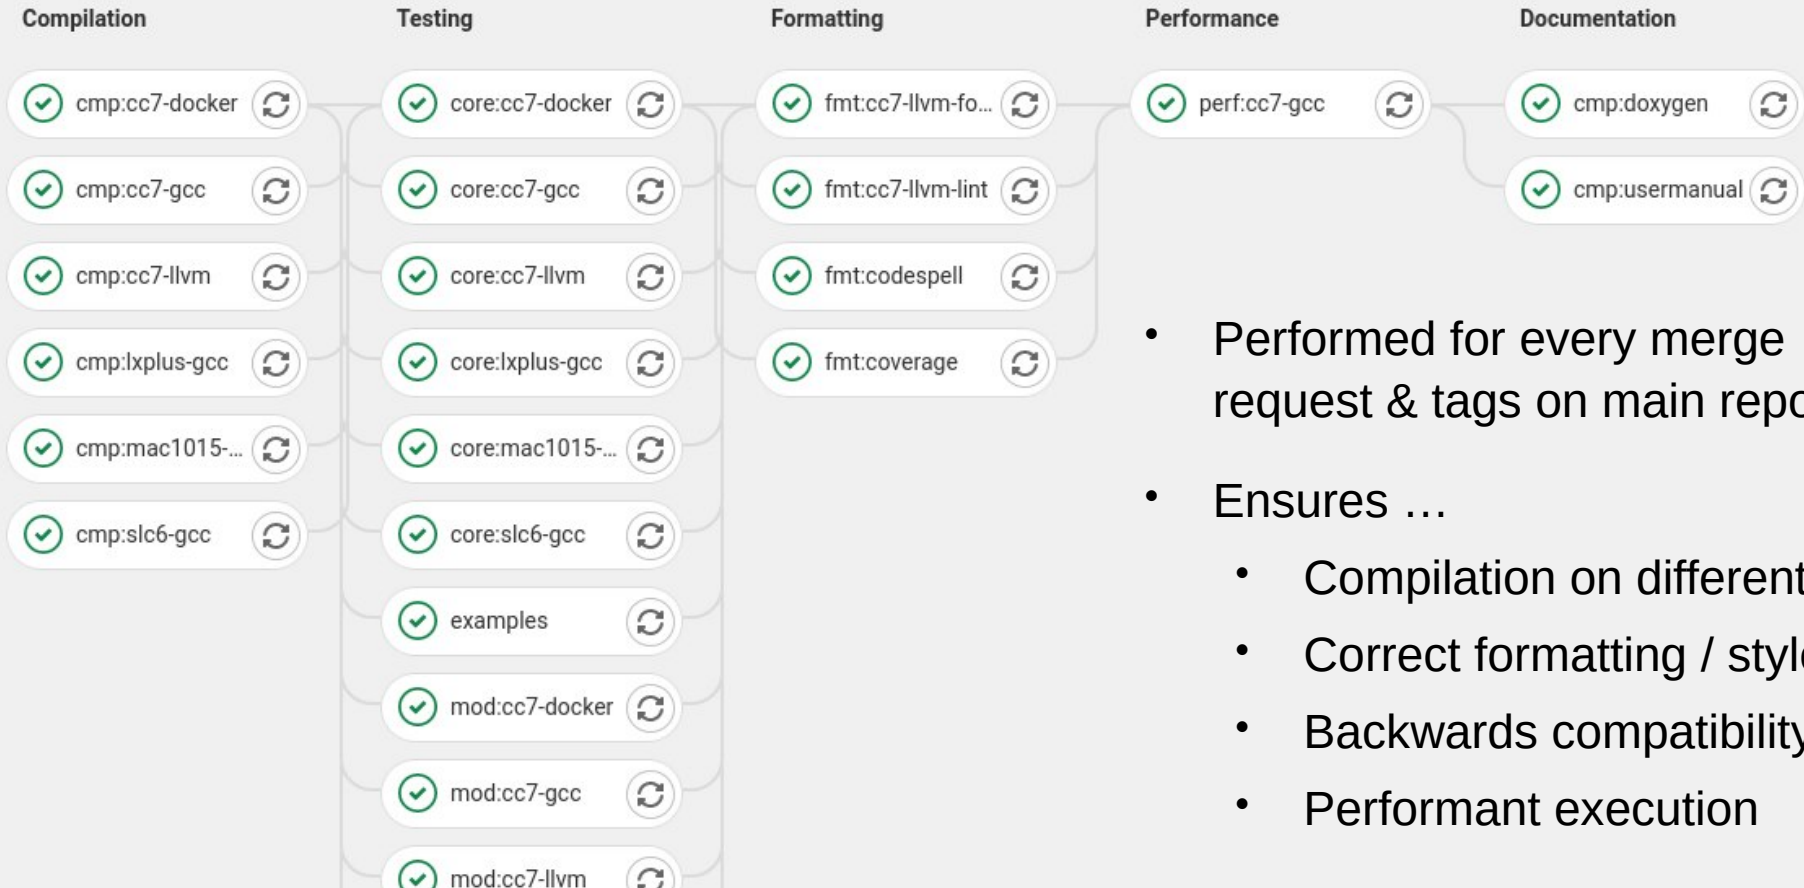

- Several output formats are already supported
 - LCIO – Linear collider community / EUTelescope
 - RCE – ATLAS pixel group data format
 - Corryvreckan – Test Beam Reconstruction framework
 - Text files – Human-readable
 - ROOTObjects – Allpix Squared data
- Allows to ...
 - perform detailed analyses of individual sensors
 - replicate a test beam experiment and analyse the simulated data with the same software as the measured data

A few other Features – Geometry

- Currently geometries are implemented for **hybrid** and **monolithic** detectors
 - Monolithic can be used for strip detectors, with 1 by n “pixels” of appropriate size
- Geometry can be configured with cut-outs in the PCB, support materials (beam windows/physical supports), bump dimensions, etc.

Excursion: Continuous Integration

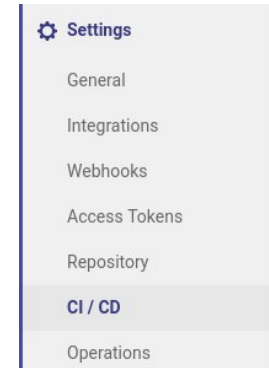

- Performed for every merge request & tags on main repository
- Ensures ...
 - Compilation on different OS
 - Correct formatting / style
 - Backwards compatibility
 - Performant execution

Excursion: Continuous Integration

What? But how?!?

- Enable runners (machines to execute jobs)
- If Pipeline fails: read the output of the failing job

Settings

- General
- Integrations
- Webhooks
- Access Tokens
- Repository
- CI / CD**
- Operations

Runners

Runners are processes that pick up and execute jobs for GitLab. Here you can [get more information](#)

You can set up as many Runners as you need to run your jobs. Runners can be placed on separate users, servers, and even on your local machine.

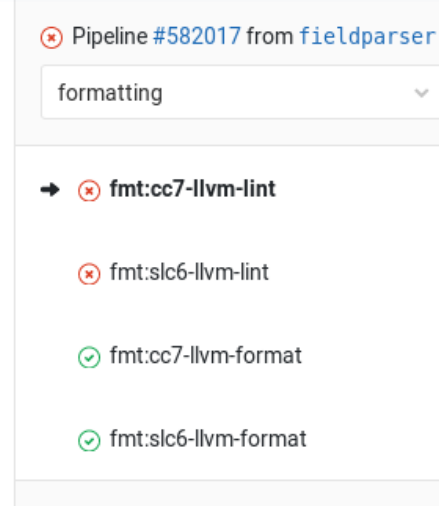

Each Runner can be in one of the following states:

- **active** - Runner is active and can process any new jobs
- **paused** - Runner is paused and will not receive any new jobs

```

✖ Pipeline #582017 from fieldparser

formatting

- ➔ ✖ fmt:cc7-llvm-lint
- ✖ fmt:slc6-llvm-lint
- ✔ fmt:cc7-llvm-format
- ✔ fmt:slc6-llvm-format

Where to go from here?

- Allpix Squared has many more features that we could not go through today
 - Transient propagation
 - Calculate pulse on readout electrode using electric and weighting field maps
 - Simulate response of charge sensitive amplifier
 - ➔ What's new on Allpix Squared?, S. Spannagel, Wed., 17:50
 - Reading in of TCAD simulated electric and weighting fields
 - Magnetic field → primary particle and charge carrier propagation
 - Passive materials → replicate test beam setups or scattering measurements
 - Point charge / MIP deposition w/o Geant4
 - Source simulation
- Many of those are represented in one of the examples: `$ cd examples/`
