

Fragmentation function measurements at BELLE

Tuesday 17 April 2007 16:10 (20 minutes)

In order to obtain precise information on helicity and transversity distributions from semi-inclusive measurements in DIS and proton-proton collisions a good knowledge of fragmentation functions is necessary.

The Belle experiment at the asymmetric e^+e^- collider KEKB can provide precise spin averaged and spin dependent fragmentation functions such as the Collins function and the interference fragmentation function.

Recent results will be shown.
