MICE RF Amplifier Status

Andrew Moss
ASTeC

Collaboration meeting, RAL,
7th – 10th July 2010

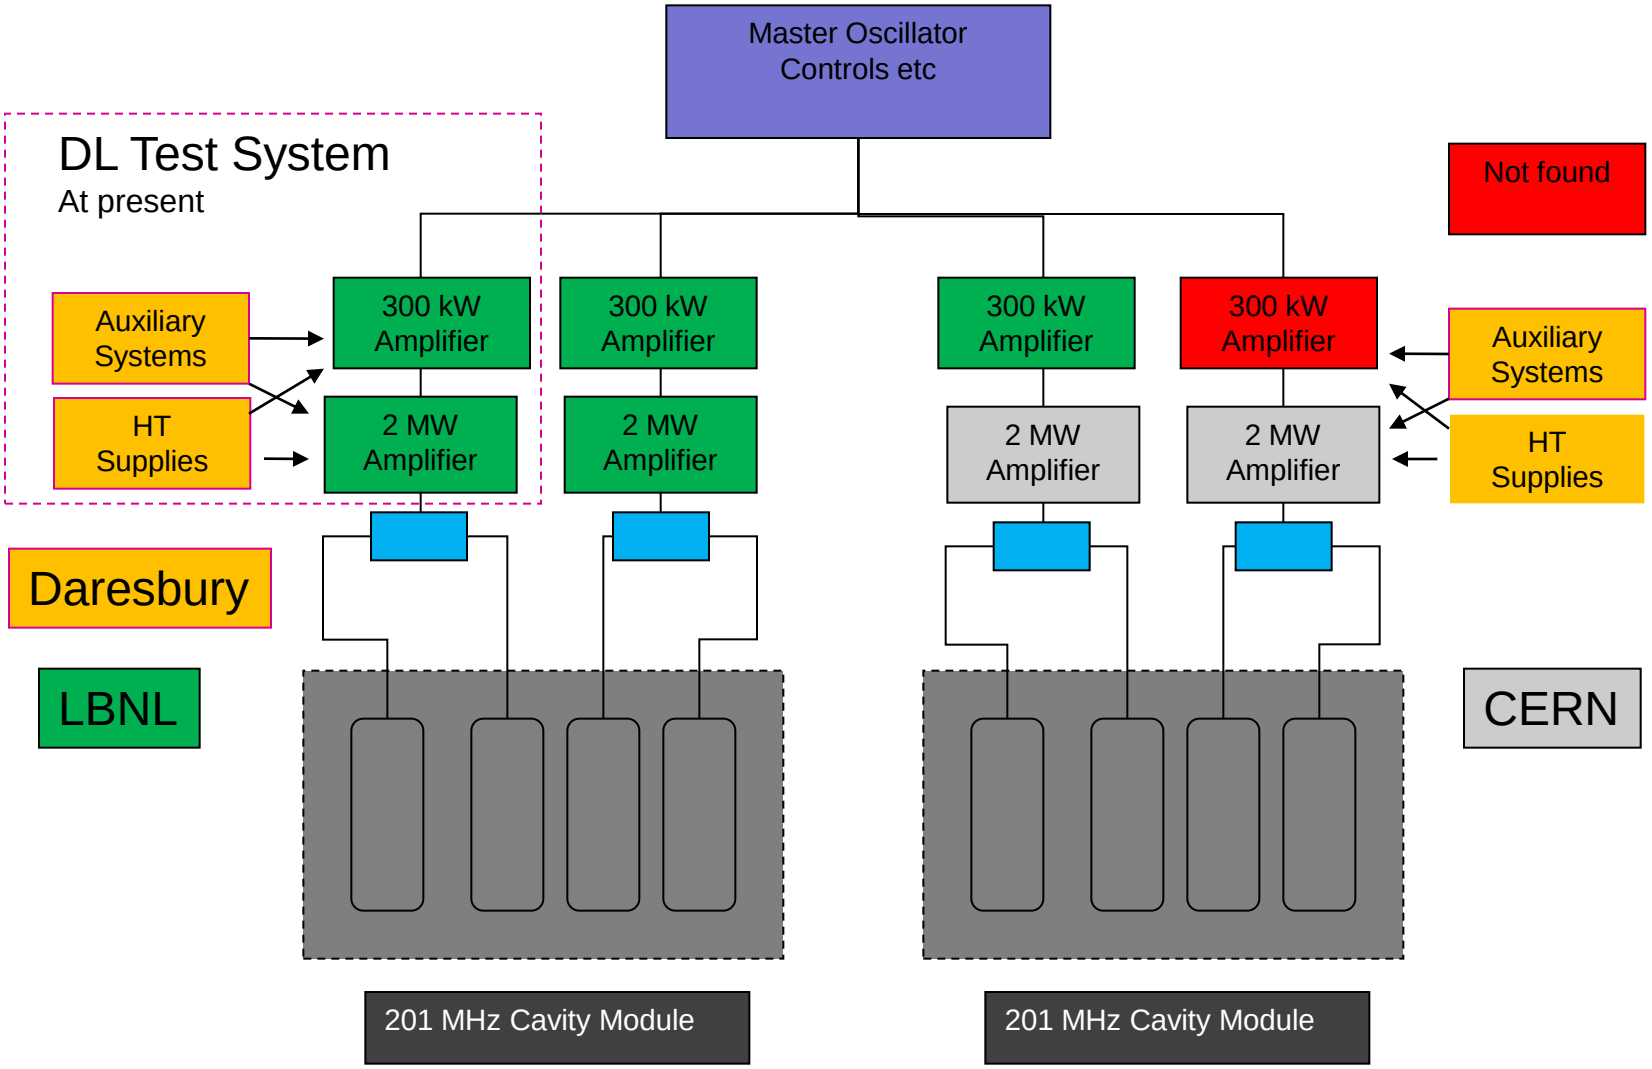
Outline

- Current status of amplifiers and power supplies
- Hall design
- Future plans
- Conclusion

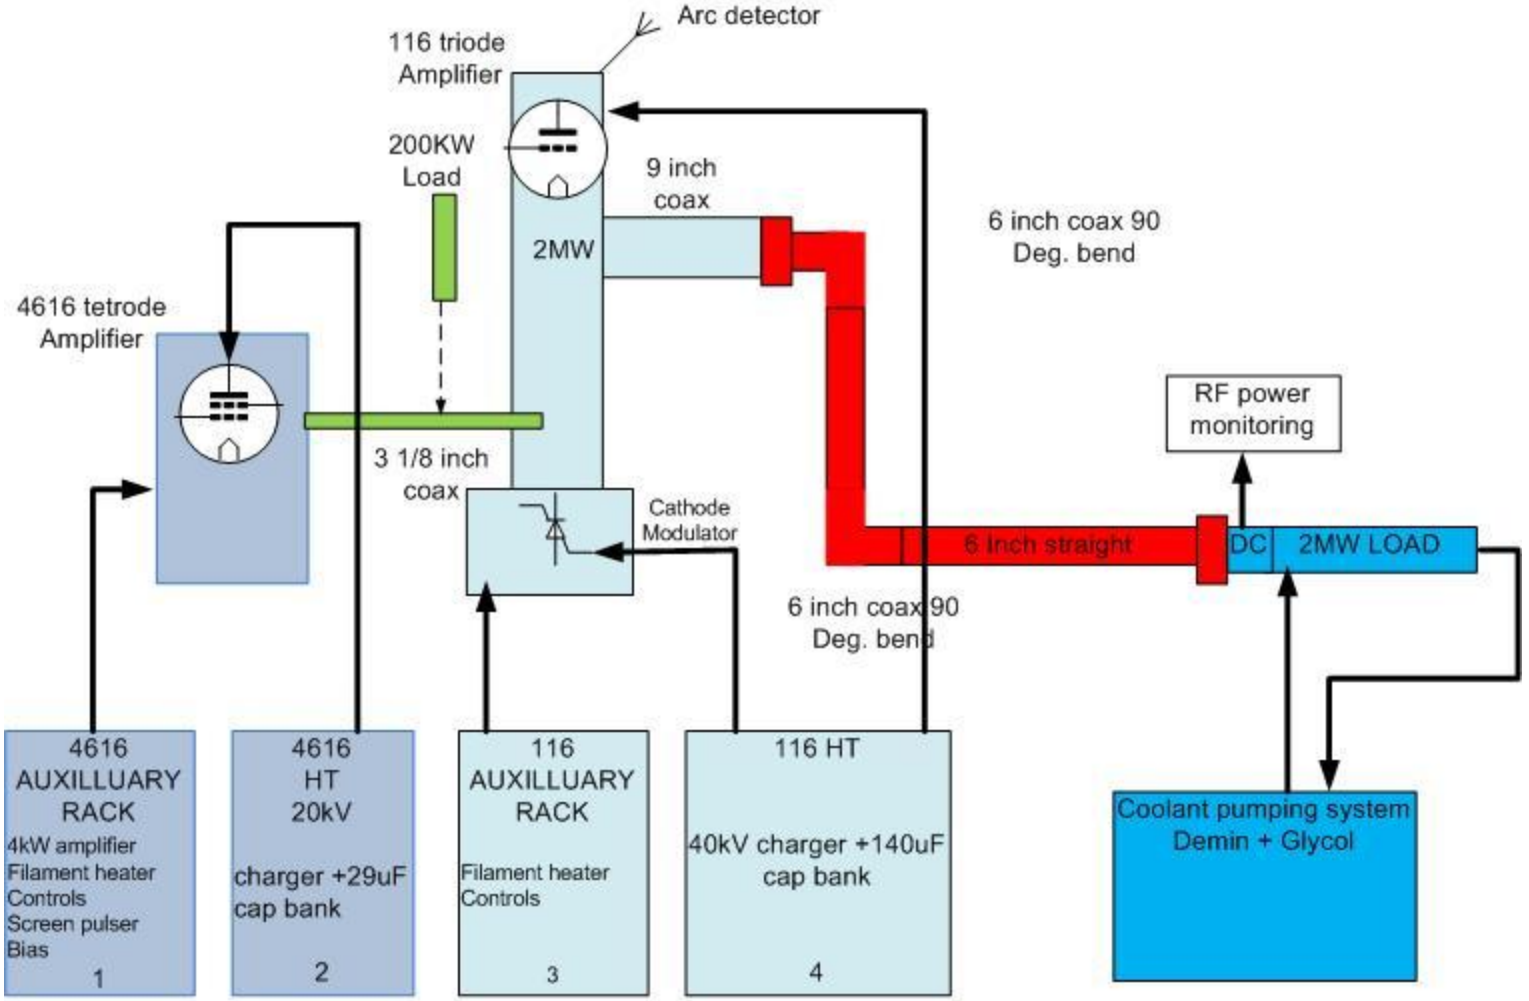
Amplifier status

- First medium power (300kW) amplifier and power supply system tested 2008
- Refurbishment and rebuild of first high power (2MW) amplifier complete October 2009
- Power supplies for first 2MW amp 95% complete
- Two further 300kW amplifiers awaiting repair
- Two refurbished 2MW CERN amplifiers partly tested, awaiting assembly and high power test
- Still need to build 3 more sets of power supplies
- One more 300kW amplifier to buy/acquire

RF system components

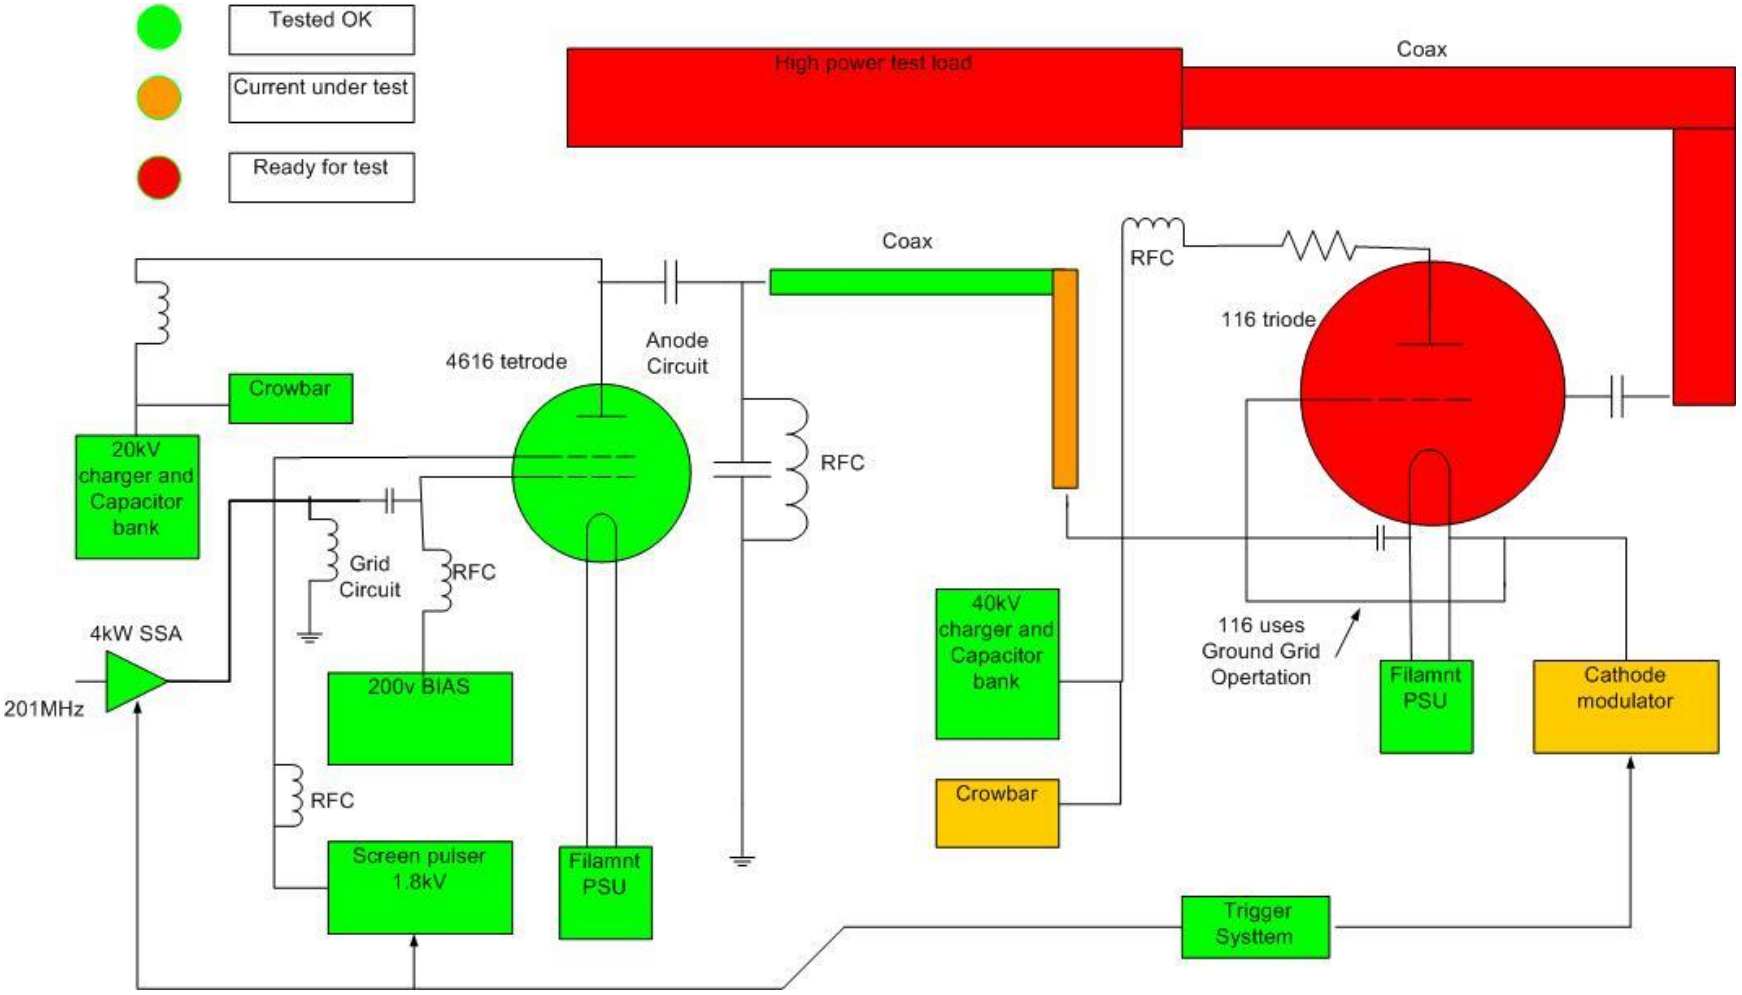


Test system at Daresbury



Daresbury test setup for proving amplifiers/power supplies

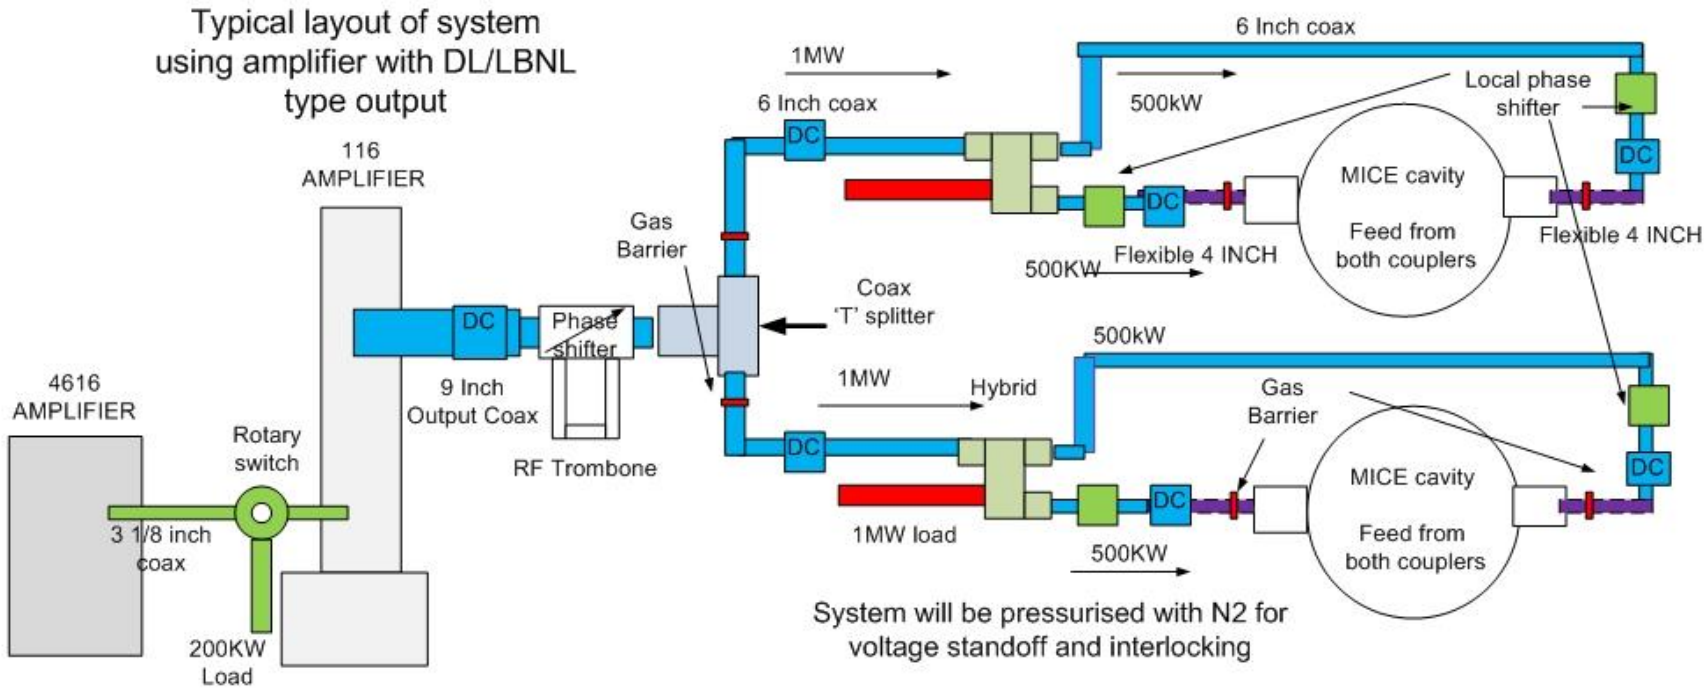
Current status of components

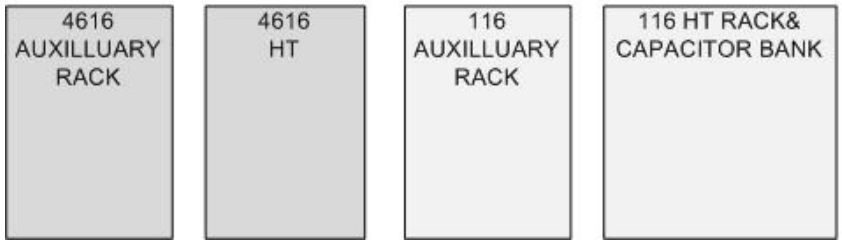


2MW amplifier summery

- Final electrical checks July 2010 – crowbar/cathode modulator systems
- Amplifier connected to test load via coax
- Water system, air blowers and compressed air have all been on
- Filament test to 500A on tube
- HT system /earth system checked out and signed off
- Safety paperwork needs completing before we power system

Predicted hall layout for RF components



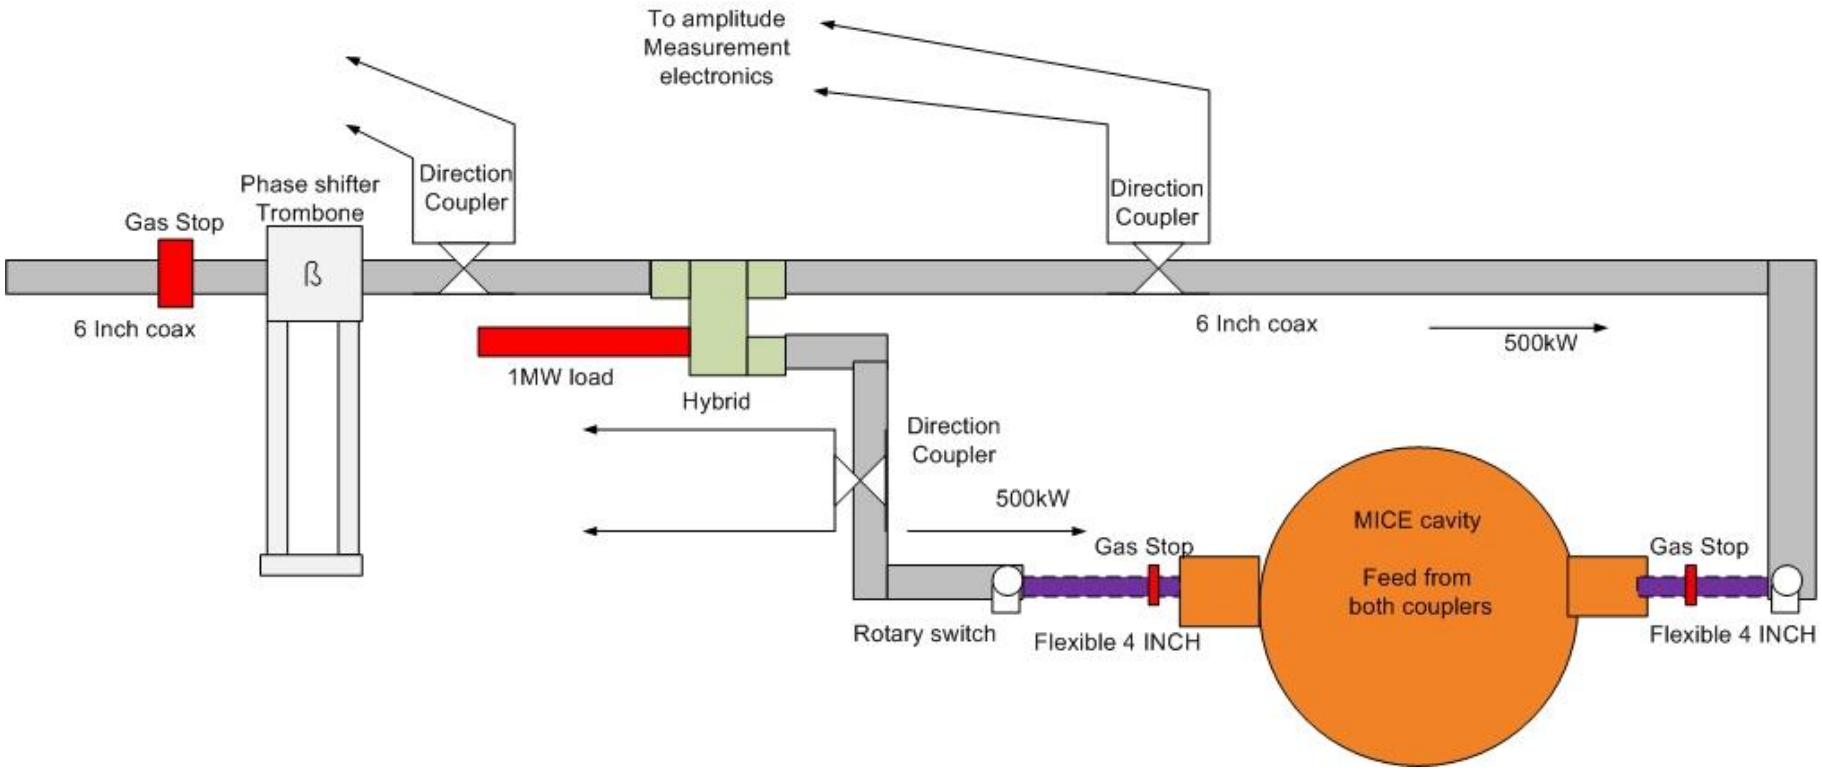


DC = directional coupler= power measurment

Coax design

- Coax system will use large phase shifter to make amplifier immune to reflected power issues
- Hybrid power splitters to divide power before each cavity with a rejection load, this should provide the a robust system
- Local phase shifters in each cavity coupler, small range available only, so need to plan coax system carefully to get phase lengths within range at the cavity input couplers
- Power monitoring in each section of coax will be linked in to RF control system so that issues can be flagged before faults occur
- Nitrogen gas pressure system with the coax for voltage stand off and interlock
- Plan to have the ability to connect test loads in place of cavity to test amplifier/coax system in its complete configuration

Coax layout for each cavity



Hall design in progress

- Working with 3D CAD engineer to plan layout between the amplifiers and cavities
- Measurements of system dimensions at Daresbury have been taken
- First step is a simple block diagram showing all components and how they are interconnected
- Then understand how to optimise components with the layout of the hall and the space available
- Result will be a complete parts list required for each cavity that we can go out for tender for when appropriate

Future plans for this year

- Test of first large amplifier is priority
- Amplifier testing likely to take 4 – 6 weeks to optimise the system using old tubes, then replace with new MICE tubes and repeat tests carefully
- Assembly of the first CERN amplifier, refurbished unit however many small parts, CERN have offered to send 2 people for a few days to aid with the assembly of the unit – we will take up this offer
- Would need to buy more coax components to test this amplifier in our system – coax bends, straights and a combiner
- First amplifier will be delivered and installed in the MICE hall

Conclusion

- Complete RF amplifier system ready for test, results expected by end September
- Design of hall components between amplifiers and cavities is in progress and will lead to a formal design of the coax system, how it will be supported and the sequence of installation
- Funding will allow building of CERN amplifier and possible refurbishment of other LBNL amplifier systems
