

# Running a multi-tenant Kubernetes with GitOps

*Wednesday 2 December 2020 09:20 (20 minutes)*

Starting in October 2020, the PATH project is making a concerted effort to transition the centrally-run OSG services (such as websites, software repositories, information services) from ad-hoc deployment models to Kubernetes.

To do so, we needed a Kubernetes “home” and an operational model! In this talk, we’ll overview the work going on in the Tiger cluster at Morgridge, our current GitOps-based workflow with Flux, and how we see things fitting into the larger ecosystem of distributed services and federated Kubernetes.
