

# Reviews of Reconstruction Anomalies

---

October 28th Update

SuperFGD Prototype Analysis Meeting

Eric Chong, Ciro Riccio, Abraham Teklu, Guang Yang

Stony Brook University & University of Pennsylvania

# Overview

---

- Quick Recap
- Different time tick cuts effect on low energy events.
- How linearity cut mimics this effect.
- Low energy and high PE/Voxel events.
  - Relationship and types of events included.

# Quick Recap

---

# Neutron Energy vs Total PE Deposit

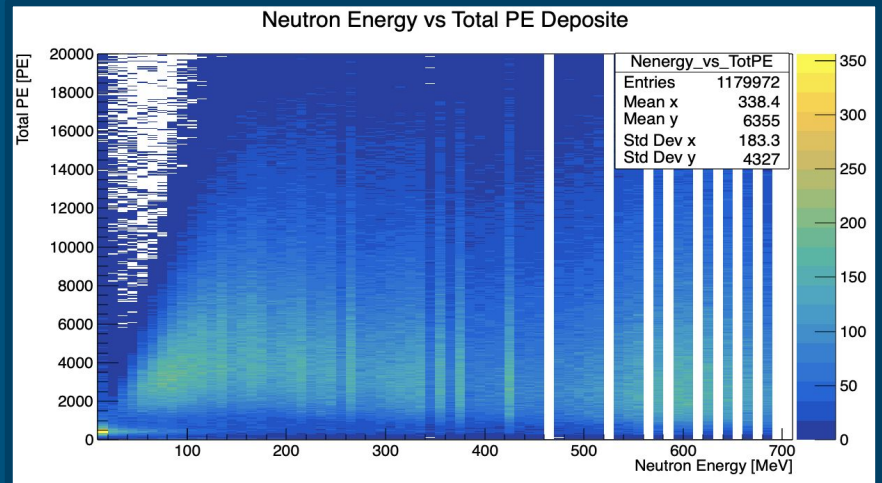

# Neutron Energy vs Cluster Size

# Plot Specifications

- Time Tick Cut of 1 tick or 2.5 ns
- Voxel PE cut of 50 PE
- Neutron Energy vs Cluster Size is Log scale

These become important to note when comparing to future plots

# Different Time Tick Cuts Effect on Low Energy Events

---

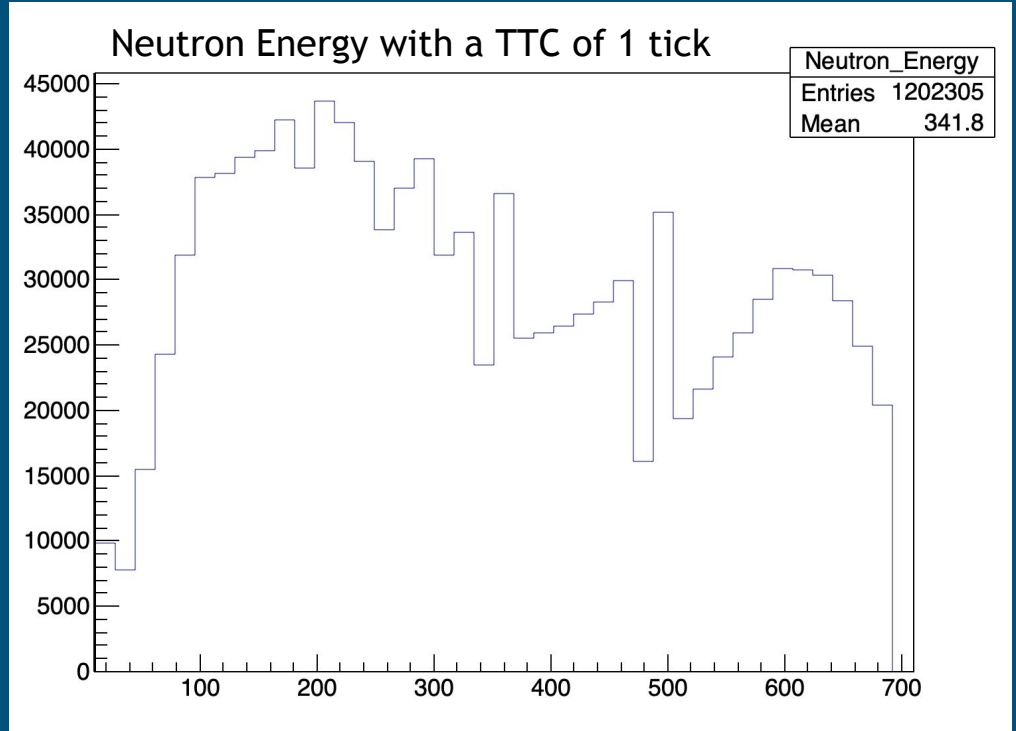

# Time Tick Cut and Energy

## Done

- ❖ 5 PE cut on Hits
  - If MP has < 3 hits cut
- ❖ Time Clustering
- ❖ Voxelization
  - 20 Voxel PE Cut
  - If SubEvent < 2 voxels cut
- ❖ Spatial Clustering

## Not Done

- ❖ Linearity Cut
- ❖ Track Fitting
- ❖ Vertex Finding

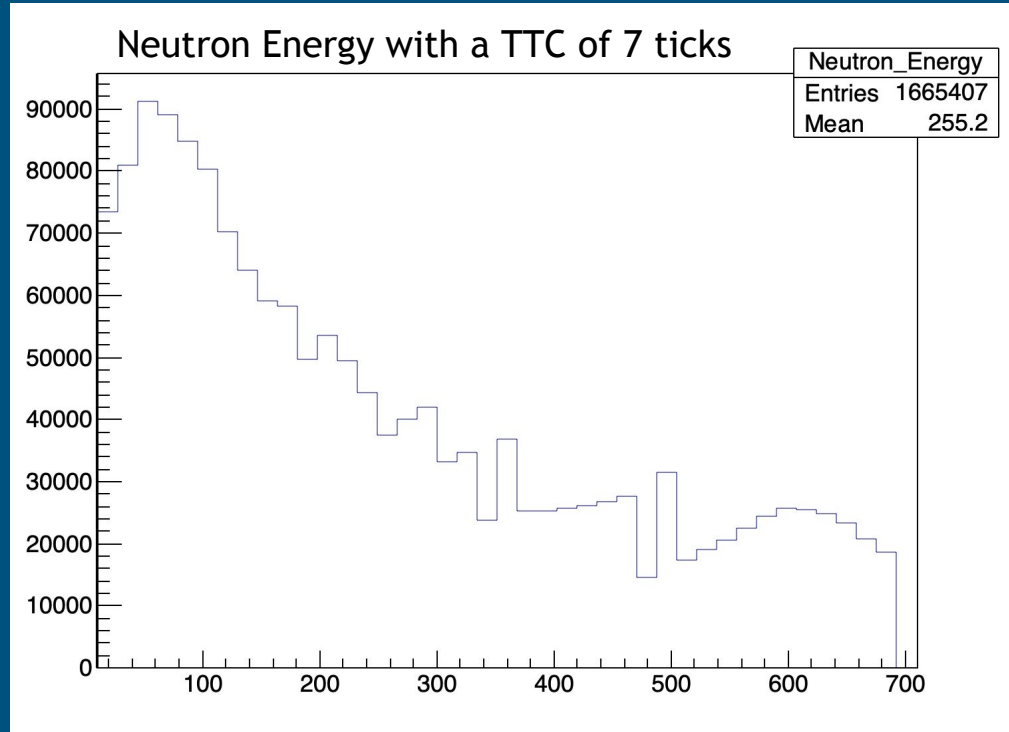

# Time Tick Cut and Energy

## Done

- ❖ 5 PE cut on Hits
  - If MP has < 3 hits cut
- ❖ Time Clustering
- ❖ Voxelization
  - 20 Voxel PE Cut
  - If SubEvent < 2 voxels cut
- ❖ Spatial Clustering

## Not Done

- ❖ Linearity Cut
- ❖ Track Fitting
- ❖ Vertex Finding

# Time Tick Cut and Energy

Neutron Energy with a TTC of 7 ticks

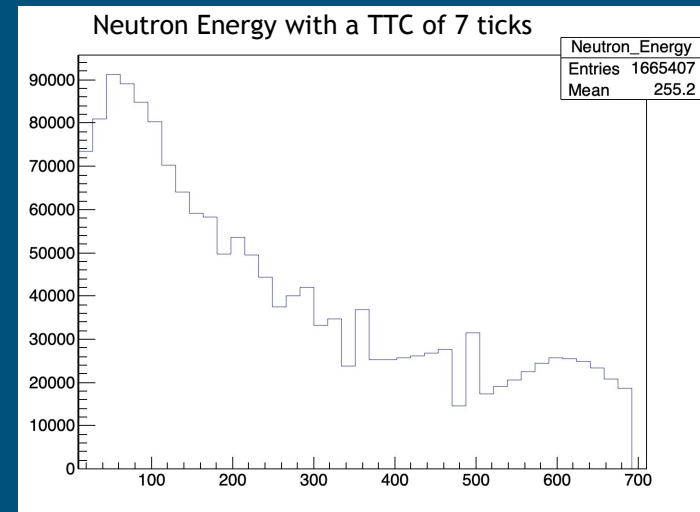

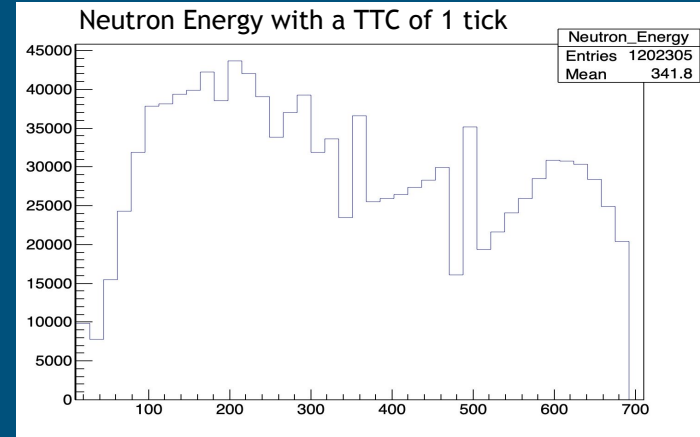

Neutron Energy with a TTC of 1 tick

# Time Tick Cut and Energy

## From a data set of 3.6 billion events

- 899,326 events are selected with a TTC of 1 tick
- 1,563,180 events are selected with a TTC of 7 ticks

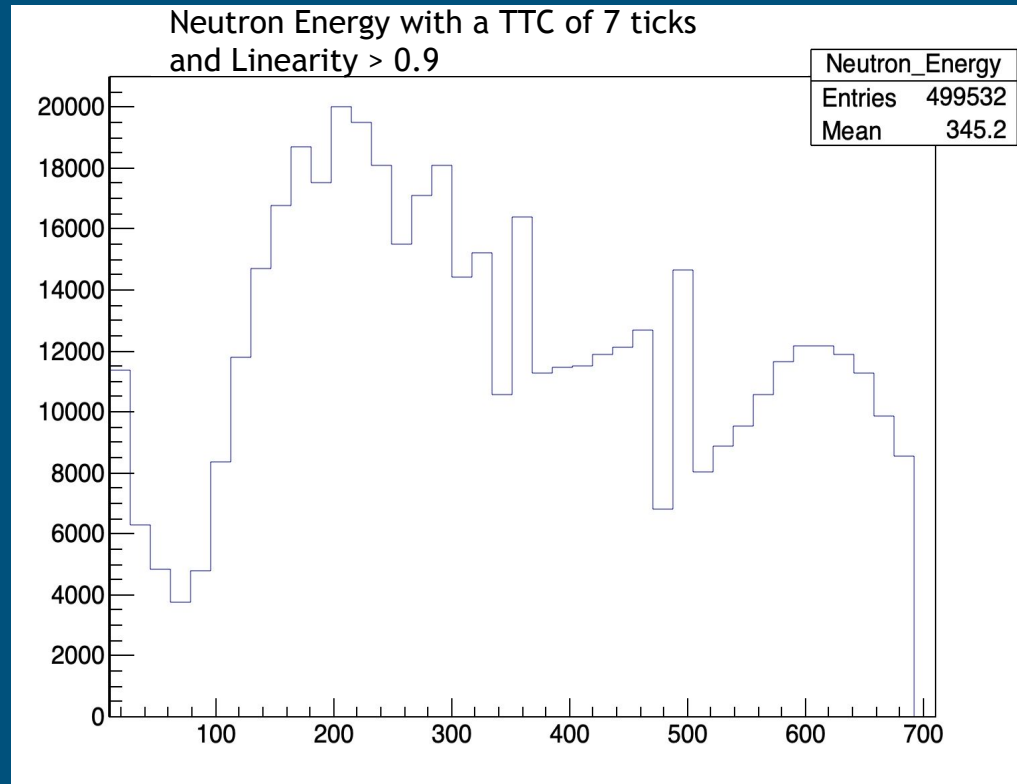

# Linearity and Energy

---

# How did we not see TTC's effect before?

A linearity cut of  $> 0.9$  also removes low energy events and mimics this effect.

# How did we not see TTC's effect before?

Neutron Energy with a TTC of 1 tick

Neutron Energy with a TTC of 7 ticks and Linearity > 0.9

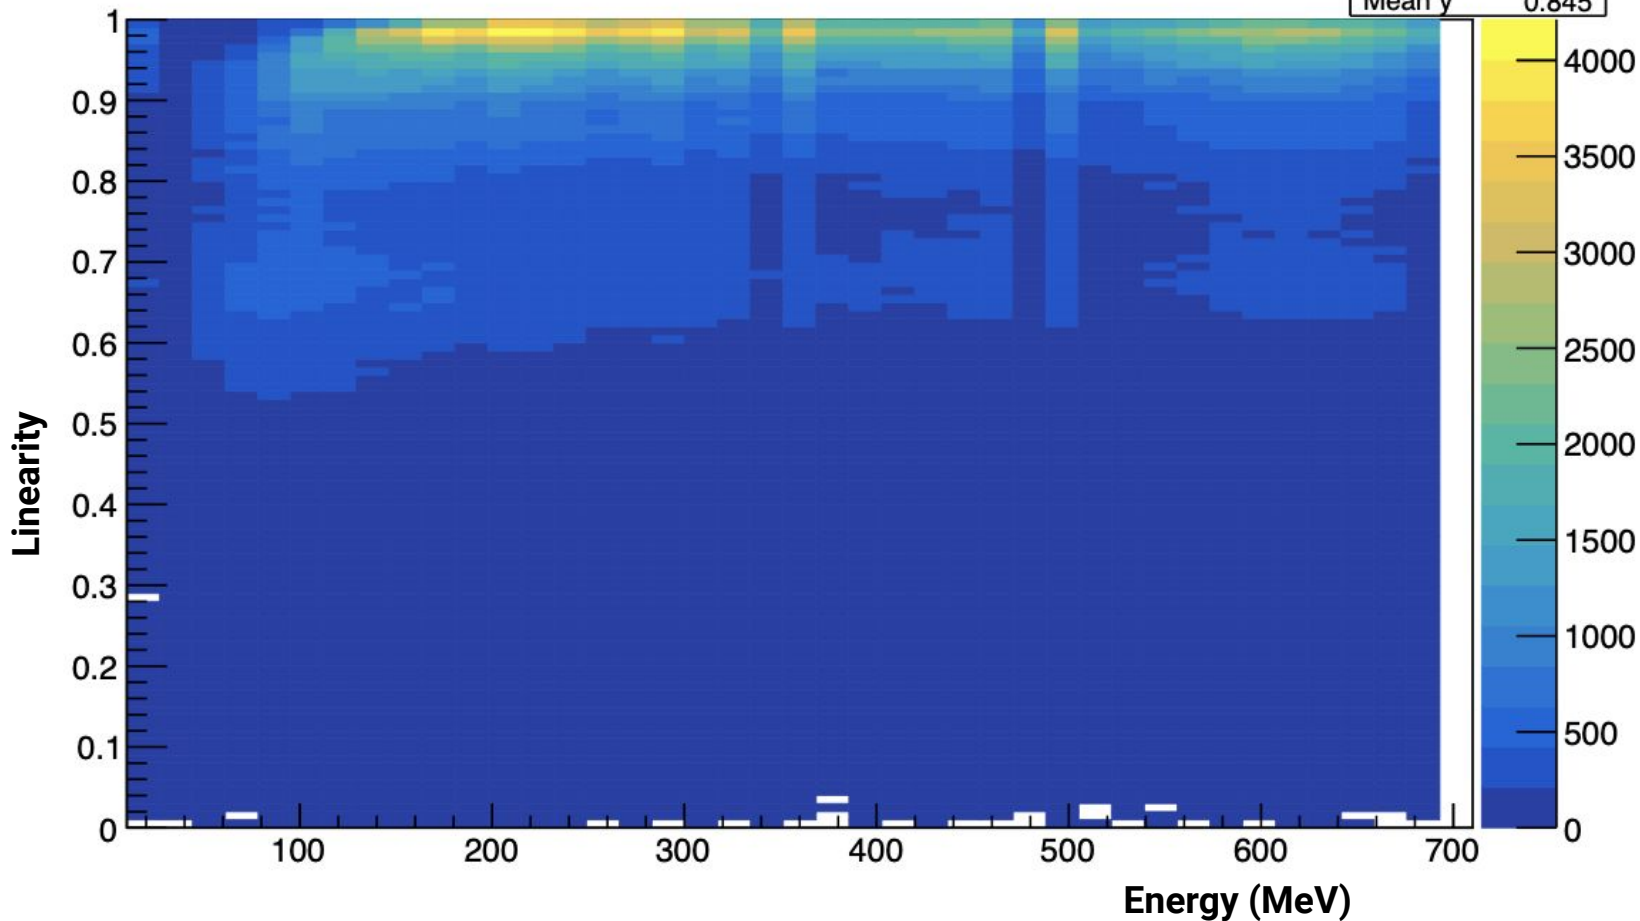

# Energy vs Linearity with a TTC of 7 tick

energy_vs_linearity	
Mean x	257
Mean y	0.6542

# Energy vs Linearity with a TTC of 1 tick

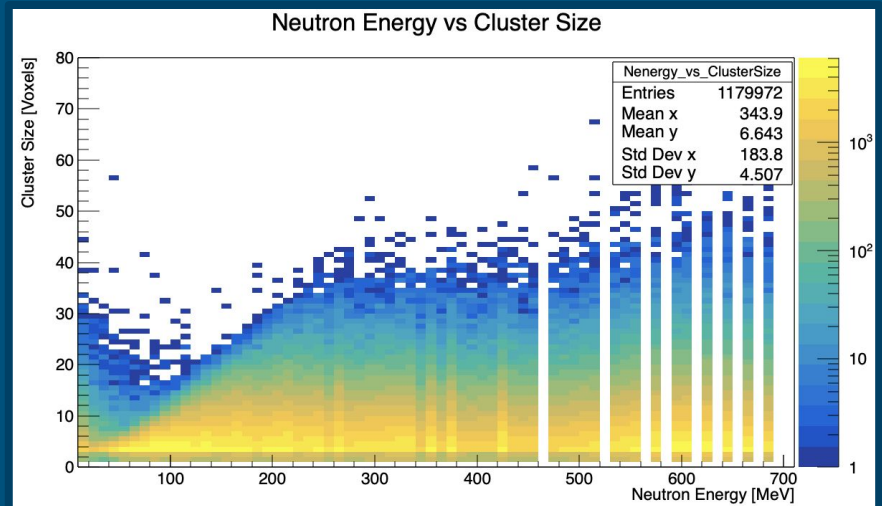

# Low Energy and High PE/Voxel Events

---

# Plot Specifications

- Time Tick Cut of 1 tick or 2.5 ns
- Voxel PE cut of 50 PE
- Neutron Energy vs Cluster Size is Log scale

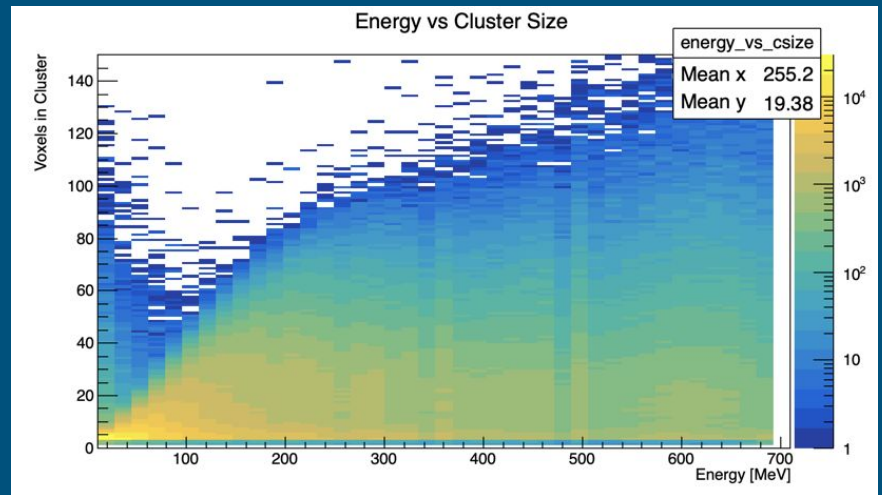

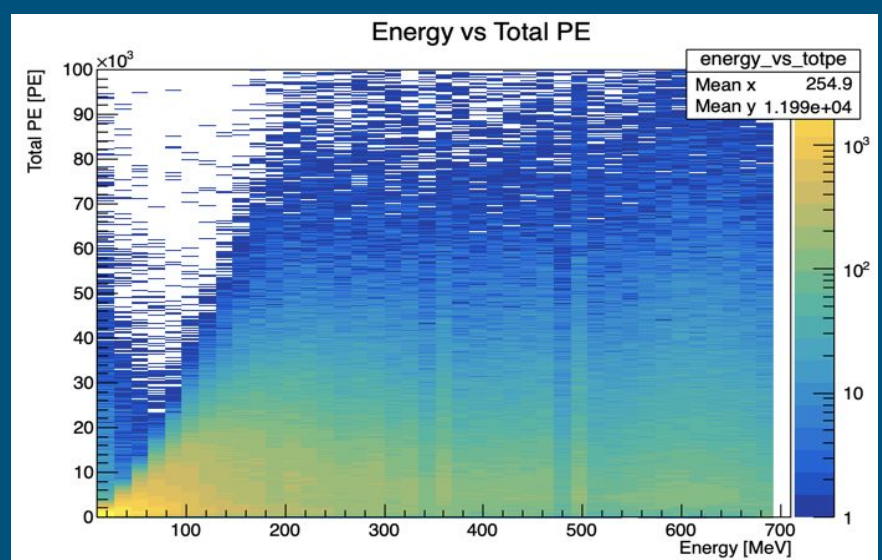

\*Because we are planning to use a TTC of 7 ticks we should look at a different set of events

# Plot Specifications

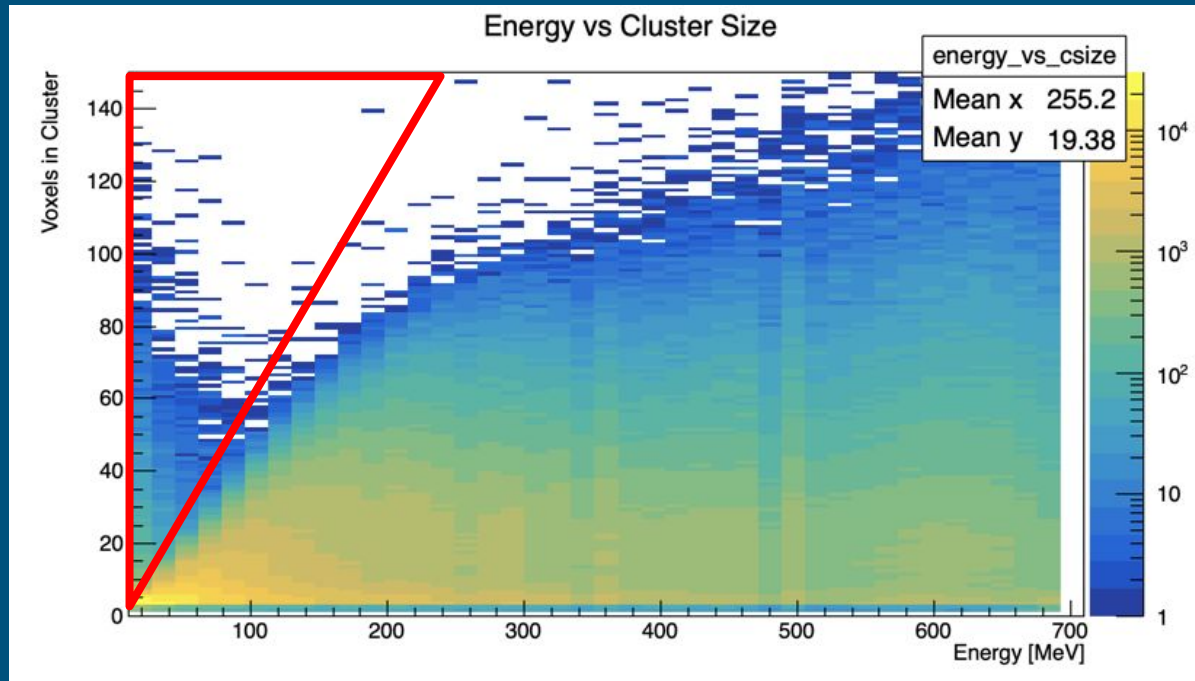

- Time Tick Cut of 7 tick or 2.5 ns
- Voxel PE cut of 20 PE
- Log scale

\*Notice the y-axis has dramatically increased range due to the increase events

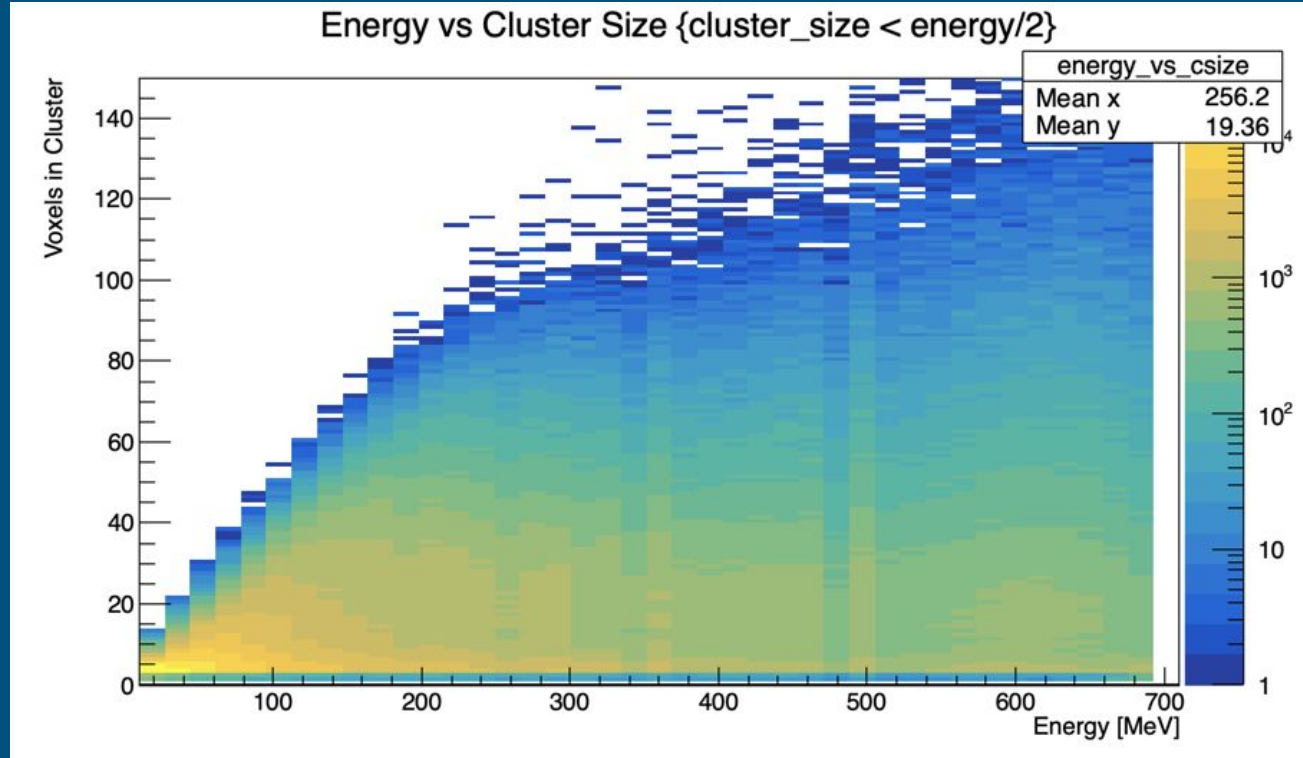

# Are High PE and High Voxel Events Related

- ❖ Compare the two variables
  - This gave somewhat unclear results
- ❖ Do a cut on one set of events and see if the other set is also completely removed
- ❖ We can do a 2d cut to remove this portion of events

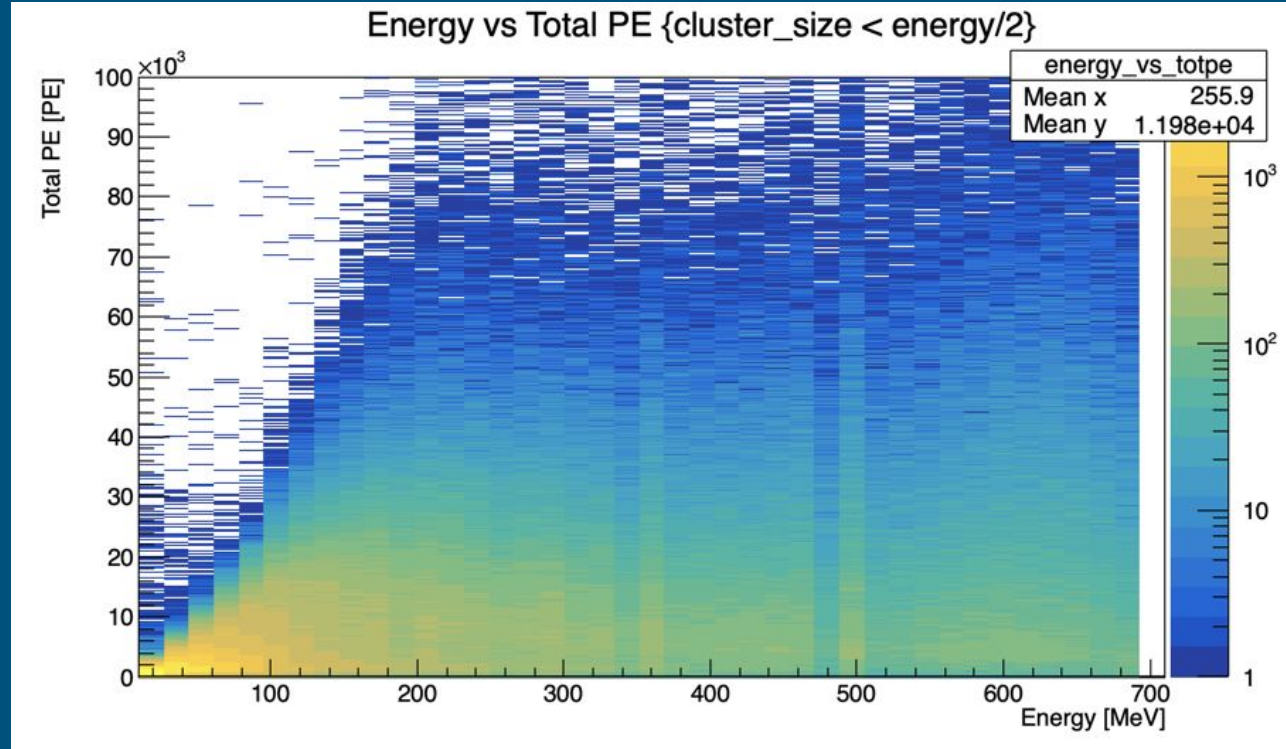

❖ Do a cut on one set of events and see if the other set is also completely removed

❖ We can do a 2d cut to remove this portion of events

# Are High PE and High Voxel Events Related

- ❖ Clearly a large portion are related, but not all the events that are low energy and (high cluster size) are (high PE)

Energy vs Total PE {totpe/1000 < energy/2}

# Energy vs Cluster Size {totpe/1000 < energy/2}

# Summary

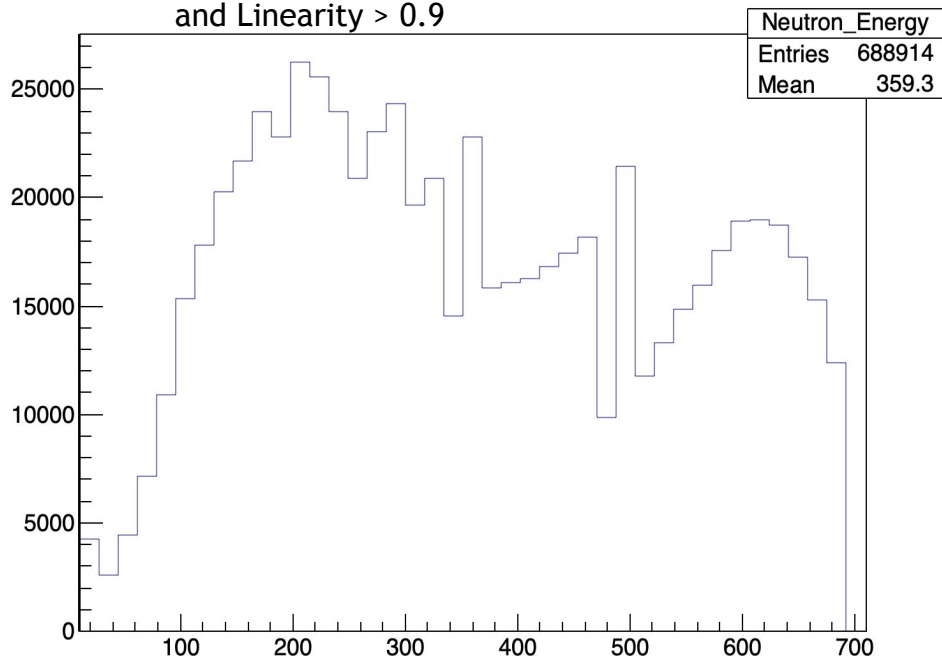

---

1. Time Tick Cut of 1 tick is removing many low energy low linearity events.
2. There are a large number of low energy low linearity events, many of which would get removed by a linearity cut.
3. The low energy and high voxel events are related to low energy and high PE events, but are not the same set of events.

# Backup

Neutron Energy with a TTC of 1 ticks  
and Linearity > 0.9

Neutron Energy with a TTC of 7 ticks  
and Linearity > 0.9
