

Study of Electroweak Penguin B Decays at Belle II Experiment

The $b \rightarrow sll$ ($l = e, \mu$) transition is a flavour-changing neutral current process that mediates through one-loop penguin or box diagrams. The decay is considered to be a good probe for the New Physics as particles predicted in the beyond Standard Model theories can enter into the loop. The exclusive decay $B \rightarrow K^{(*)}l^+l^-$ was first observed by the Belle experiment, and it provides many observables such as the branching fraction, CP asymmetry and forward-backward asymmetry and other angular observables. Recently, the LHCb experiment has reported some clue of a lepton universality violation from the branching fraction ratio of the $B \rightarrow K\mu^+\mu^-$ and $B \rightarrow Ke^+e^-$ decays. In this presentation, we report the status of the analysis of the $B \rightarrow Kl^+l^-$ decay at the Belle II experiment which started the data taking in 2019. We also present an activity at the Belle II Chulalongkorn University group where we study the $B \rightarrow KJ/\psi$ decay that has the same topology as the $B \rightarrow Kl^+l^-$.
