Status update for web-based ALICE MasterClass

mgr inż. Piotr Nowakowski

IMC SG meeting
30 November 2020

Why web?

- **“Plug and play” operation, as only a modern web browser is required (almost always already installed), no other software requirements**
- **“One code rules all” – due to browser abstraction distinction for devices (ARM, PC computers) or OSes (Windows, Linux, OSX) not required in the code**
 - ****Almost** – for best user experience special handling for touchscreen devices recommended**
- **No installation required for using the online version**
- **Possible to use technologies like *Electron* to make a standalone, installable, offline version**

Why not?

- **Standard features known from ROOT (histograms, 3D rendering, handling event data, function fitting and other heavy math, running scripts) not available as “baseline”**
 - **Library hunting (github, node packages) or implementation from scratch required**
- **First two features could be in theory fulfilled by JSROOT**
 - **ROOT functionality and “look & feel” out of the box for them**
 - **Surprisingly designed as a monolith, all-purpose app – very impractical to use with other community libraries which can provide UI control etc.**
- **Some elements of exercises might require simplification to make them work better in JS**

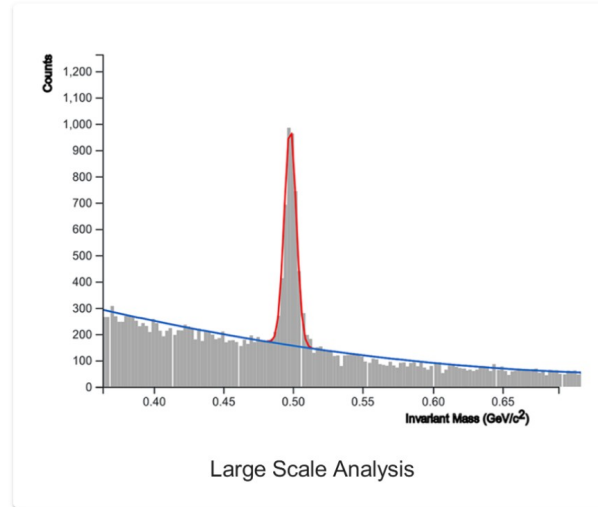

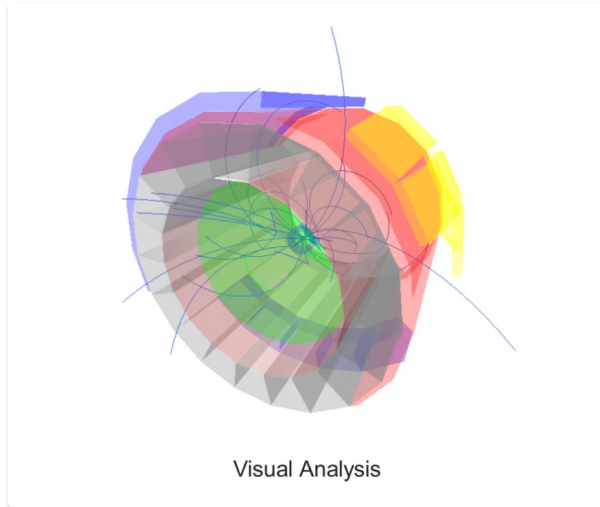

ALICE Web MasterClass

- **Initial work already done**
- **Based on heavily modified LHCb MasterClass**
- **Proof-of-Concept of the Strangeness MasterClass**
 - **Internally tested at WUT with students**
- **A major refactor of the code required before further development (e.g. other exercises)**
- **Nevertheless, with some issues both the Visual and Large Scale Analysis work and can be completed**
