## Development of MgB<sub>2</sub> superconducting wires at Sam Dong Co., Ltd.

*Thursday, November 18, 2021 10:00 AM (20 minutes)*

MgB<sub>2</sub> has been regarded as the most attractive candidate for the next-generation superconducting material due to its high critical temperature and low material cost. Sam Dong Co., Ltd., Korea, is a supplier that produces a variety of the MgB<sub>2</sub> superconducting conductors to meet customers' requirements over the past 6 years. Recently, we have increased the area fraction of multifilamentary MgB<sub>2</sub> wire up to 20% by controlling the particle size distribution and powder densification, resulting in high critical current. In addition, carbon doping further improved the critical current density in a high magnetic field. The critical current densities were estimated to be 120,000 A/cm<sup>2</sup> at 6 T at 4.2 K and 16,000 A/cm<sup>2</sup> at 3 T and 20 K, respectively. In this conference, we will introduce and discuss a newly developed MgB<sub>2</sub> wire of Sam Dong Co., Ltd.

**Primary author:** Dr CHOI, Jun Hyuk (Sam Dong Co., Ltd.)

**Co-authors:** Mr LEE, Dong Gun (Sam Dong Co., Ltd.); Mr JEON, Ju Heum (Sam Dong Co., Ltd.); Dr MAEDA, Minoru (Kangwon National University); Prof. CHOI, Seyong (Kangwon National University); Prof. KIM, Jung Ho (University of Wollongong)

**Presenter:** Dr CHOI, Jun Hyuk (Sam Dong Co., Ltd.)

**Session Classification:** THU-PO3-605 MgB<sub>2</sub> and Iron-based Wires and Cables
