Oral talk at THU-OR4-401-05 session on  
Magnets for Medical, Biological, and Analytical Applications

# Summary

A collaboration between CERN, CNAO, INFN and MedAustron has been formed with the aim at designing a light rotating gan-try suitable for hadron therapy based on 450 MeV carbon ion beams.

After a preliminary design based on 3 T dipole field, [see related paper in this session by M. Karppinen](#), now the collaboration [is engaging to improve the design to 4 T dipole field, or possibly more](#). The magnets are designed according to  $\cos\theta$  layout to be wound with Nb-Ti conductor, most probably a Rutherford cable.

The main challenge of this magnet is the very small curvature radius of 1.65 m with a relatively large aperture, 70 to 90 mm. Another considerable challenge is the use of indirect cooling (most probably cryogen-free) despite the cycling operation with 0.3-0.4 T/s. The design of these 4 T dipoles, to which will be superimposed a further 0.3 T of quadrupole field, is therefore very challenging. The paper will report the preliminary computations on various configuration aiming at 4 T with typically 20% margin in operative conditions. A 1 m long demonstrator will be manufactured at INFN-LASA in three years. A candidate conductor has been measured, with 3 micron Nb-Ti filaments embedded in a Cu-Mn alloy matrix. The resulting gantry is very compact: with proper integration between gantry structure and magnets the rotating weight maybe less than 50 tons, a factor five gain on the pre-sent state-of-the art.

## Fighting against cancer

Nuclear medicine as crucial component of future personalised cancer care  
**Develop advanced cancer therapy with ion beams and isotopes**

## Building international cooperation and scientific capacity in South East Europe

**Advance European integration, reverse brain drain, connect to Europe**

Two Strategic Objectives  
–  
One initiative

# Comprehensive Dimension: both Cancer Therapy and Research Center with 50% of the beam time dedicated to research – other Unique Selling Points

## MULTI-DISCIPLINARY RESEARCH WITH HEAVY IONS

- Pre-clinical (medical, radiobiology)
- Clinical, including clinical trials
- Industrial research (microelectronics)
- Material research
- Ultra-high dose rates (FLASH)

Cutting-edge innovative and novel research in any of these topics driven by novel technological opportunities  
Complementary to all existing facilities

## BREAKTHROUGH IN TECHNOLOGY

- Multi-ion synchrotron (beyond presently used p and C-ions)
- **More compact and much cheaper Superconducting synchrotron**
- **Superconducting gantry**
- Higher beam intensity, faster extraction; Real time imaging

Will make cancer treatment with ions accessible to a large fraction of the European population and bring back Europe the lead position in this field

## SCIENCE DIPLOMACY

- Declaration of Intent signed at CERN in October 2017 by 8 SEE countries
- MoC signed by 6 Prime Ministers of the SEE Region in July 2019, at the Summit of Berlin Process, Poznan
- Political support by the Swiss Government to establish SD roadmap

With the strong supporting consortium of 18 European research centers and clinics the SEE region is trying to revive its technological tradition

# SEEIIST – First Green Infrastructure in line with Horizon Europe Cancer Mission

SC magnet based  
synchrotron  
(not baseline)

SC magnet  
based gantry  
(baseline)

Gantries are a key tool for particle (hadron) therapy  
However, for ions they are bulky and expensive  
Compact superconducting magnets are changing the scene

Heidelberg (De)HIT  
First ion gantry ever  
Resistive magnets  
600 tons rotating  
25 m long (2012)

HIMAC- QST NIRS (Jp)  
**First SC gantry ever**  
2.3-2.9 T from 2018  
Ca. 300 tons

# Pursuing an idea from TERA and CERN (collaboration with LBNL) for a **light gantry**...

Design based on  
CCT magnets

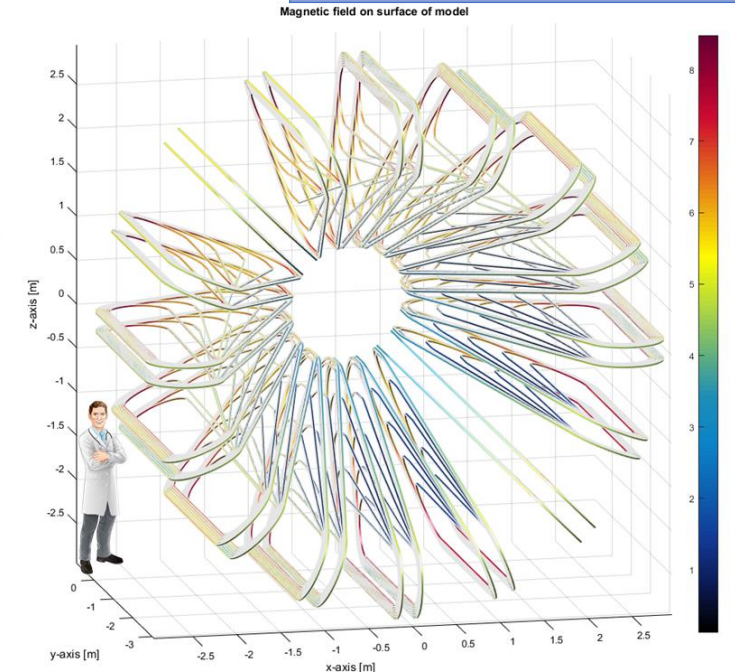

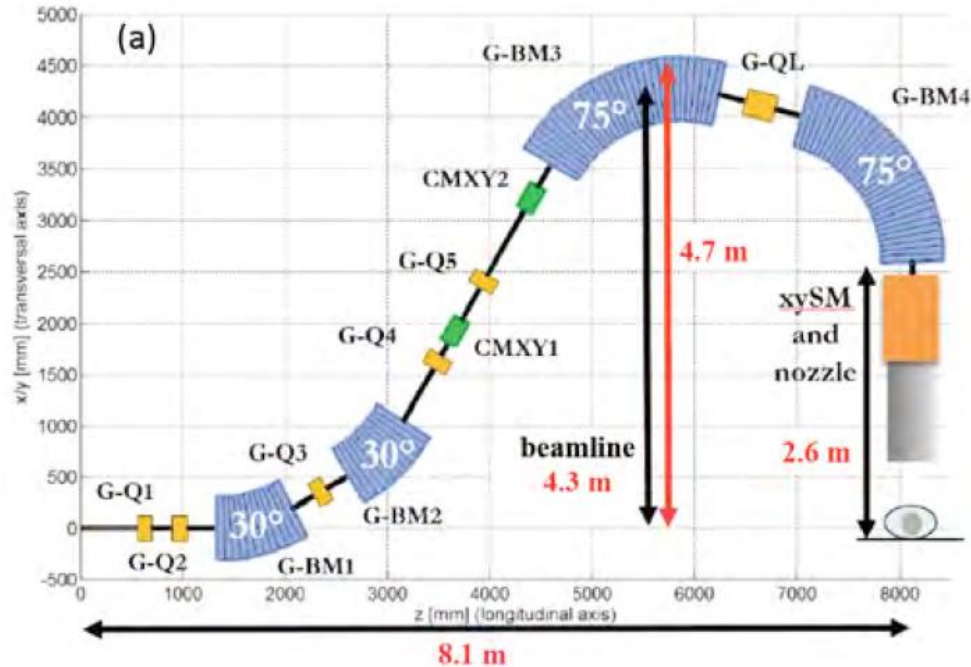

*Conceptual sketch*

Alternative: Toroidal gantry  
pursued by CERN as R&D  
(mainly for protons)

collaboration  
CERN-CNAO-MedAustron-INFN  
on C-ion GANTRY:  
**4-Party Agreement**

- Improve the efficiency (medical effectiveness and treatment time) of the present facilities
  - CNAO (Pavia, IT)
  - MedAustron (Vienna, AT)
- Design a gantry compatible with the present layout without large civil engineering and infrastructure investment
- Leveraging the design capability and technology infrastructure of HEP community (CERN) to strengthen the medical technology in EU.  
→ **NIMMS program at CERN** led by M. Vretenar

CNAO

MedAustron

# TERA → CERN → 4-Party Agreement Gantry SIGRUM\_v1.0

Present design based on  $\cos\theta$  : 3 T dipole ( $\pm 0.3$  T gradient field)

Less than 50 tons

# HITRI<sup>plus</sup> and I.FAST EU initiatives on CCT magnets for ion therapy: large collaborations for magnet R&D

**cea** **CERN** **Ciemat** **Wigner** **SEE IST** **HITRI<sup>plus</sup>**  
South East European International Institute for Sustainable Technologies  
Heavy Ion Therapy Research Integration

**SENTRONIS**

**INFN** **PAUL SCHERRER INSTITUT** **UPPSALA UNIVERSITET** **iFAST**  
Istituto Nazionale di Fisica Nucleare **PSI**

**HITRI<sup>plus</sup>** & **iFAST**  
Heavy Ion Therapy Research Integration

**Bilfinger** **ELYTT ENERGY**  
Bilfinger Noell GmbH

**SCANDITRONIX**

These initiatives are parallel to the 4-Party Agreement, devoted mainly to advancing magnet technology in EU

The EU programs HITRIplus and I.FAST will explore CCT design for 4-5 T, 60-90 mm aperture,  $dB/dt = 0.1-0.5$  T/s

**HITRIPlus (activity mainly in the Labs)**

- We want check how to make **CURVED CCT with  $R = 1.5 - 2.5$  m !!**

**I.FAST: exploring CCT with HTS and combined function!. Labs → Industry**

Configuration I - 2 x rutherford cable (40 wires)

Paper 381 – L. Rossi et al., A European collaboration to investigate Superconducting Magnets for Next Generation Heavy Ion Therapy, EUCAS2021 – submitted to IEEE-TAS

Outer layer

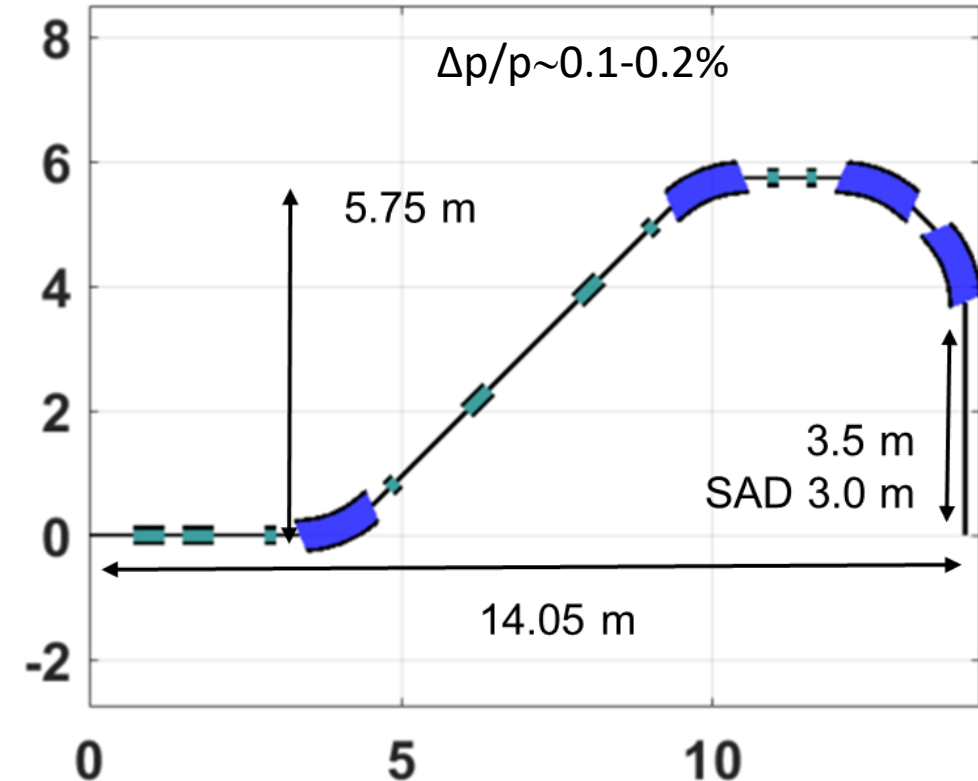

CCT coil wound with CORC  
Courtesy of Xiaorong Wang (LBNL)

International review called by 4-Party Agr., Dec. '20  
 → explore field  $B_{\text{dip}} \sim 4 \text{ T}$  ( $\text{dB}/\text{dt} \sim 0.3\text{-}0.4 \text{ T/s}$ )

**New solution: DT1; 6×30°dipoles B=4 T**  
**Nested quadrupole inside each dipole**

**New solution: EF6; 4×45°dipoles with**  
**combined quad.  $B_{\text{peak}} = B_d + B_q = (4 + 0.2) \text{ T}$**

# SIG – Superconducting Ion Gantry

- Our team (INFN-Mi-LASA and INFN-Genova) has applied to a competitive call by CSN5, and got a grant of 1 M€. The heart of the program (2022-2024) is the:
  - Design and construction of a cos $\theta$  demonstrator for the SGRUM gantry, 4-5 T,  $\varnothing = 70-90$  mm
    - $B_p = 6.6$  Tm; 4 T  $\rightarrow R_{\text{bend}} = 1.65$  m
    - 30° wide  $\rightarrow L \sim 1$  m
    - dB/dt .3÷.4 T/s (cryocooled)
      - $\rightarrow$  Nb-Ti low loss, 2÷3  $\mu\text{m}$  filam, CuMn matrix (low  $J_c$ , too...)
  - Test in LHe and then indirect cooling
- The program SIG includes also
  - Study of fast scanning magnets
  - Study of a novel Dose Delivery + Range Verification system  $\rightarrow$  adaptive treatment (+ possibly MRI imaging)
- Budget for the SC magnet demo:
  - 1260 k€ (Material incl. touch labour + temporary personnel for 8 FTE-y)
    - 660 k€ INFN grant
    - 600 k€ Contribution CNAO and CERN
  - 12 FTE-y Personnel INFN
  - Support from staff CNAO and CERN

# Synoptic view of all main project of cos $\vartheta$ (plus HIMAC) with «Energy» vs. beam radius (curvature)

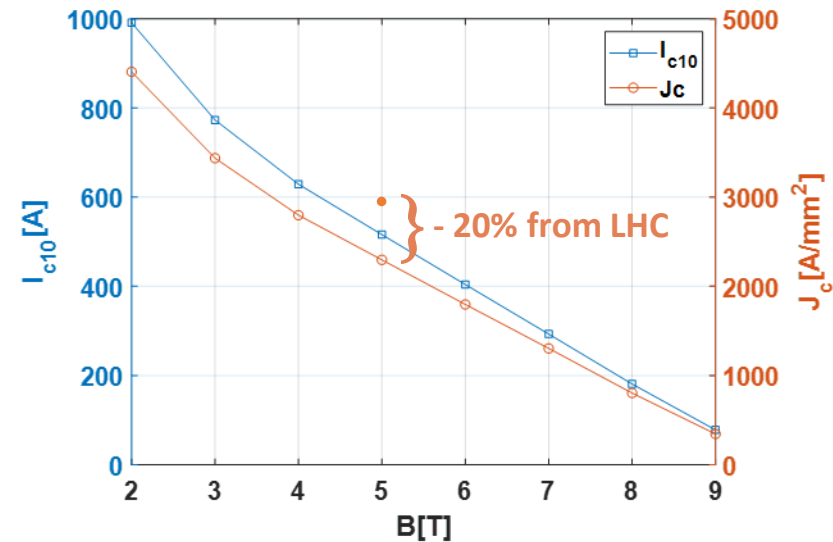

- Used Field (without iron) × Aperture to grade the difficulty of the magnet
- Plotted vs the magnet curvature (beam path radius)
- HEP dipoles are almost straight...
- GSI-FAIR SIS100 and SIS300 have noticeable curvature (however > 65 m, still)
- HIMAC SC gantry: 30 times less!!

# Conductor first: Nb-Ti for first demo

- Nb-Ti from DISCORAP project INFN with GSI for FAIR SIS300 dipole – 4.5 T 0.6 T/s in LHe
- 0.82 mm dia. Coated Sn(5%Ag)
- ~3  $\mu\text{m}$  filament size (2.6  $\mu\text{m}$  measured: microgr. and magnet.)
- In CuMn matrix
- 1:1.36 Cu/nonCu
- Left over both from Luvata and Bruker production

Features	Value	Meas. unit
Diameter	0.821	mm
Cu/NoCu	1.36	-
Twist length	6.6	mm
$J_c$ (5T @ 4.2 K)	2296	A/mm <sup>2</sup>
$I_c$ (5T @ 4.2 K)	516	A
RRR	135	-
n	>30	-

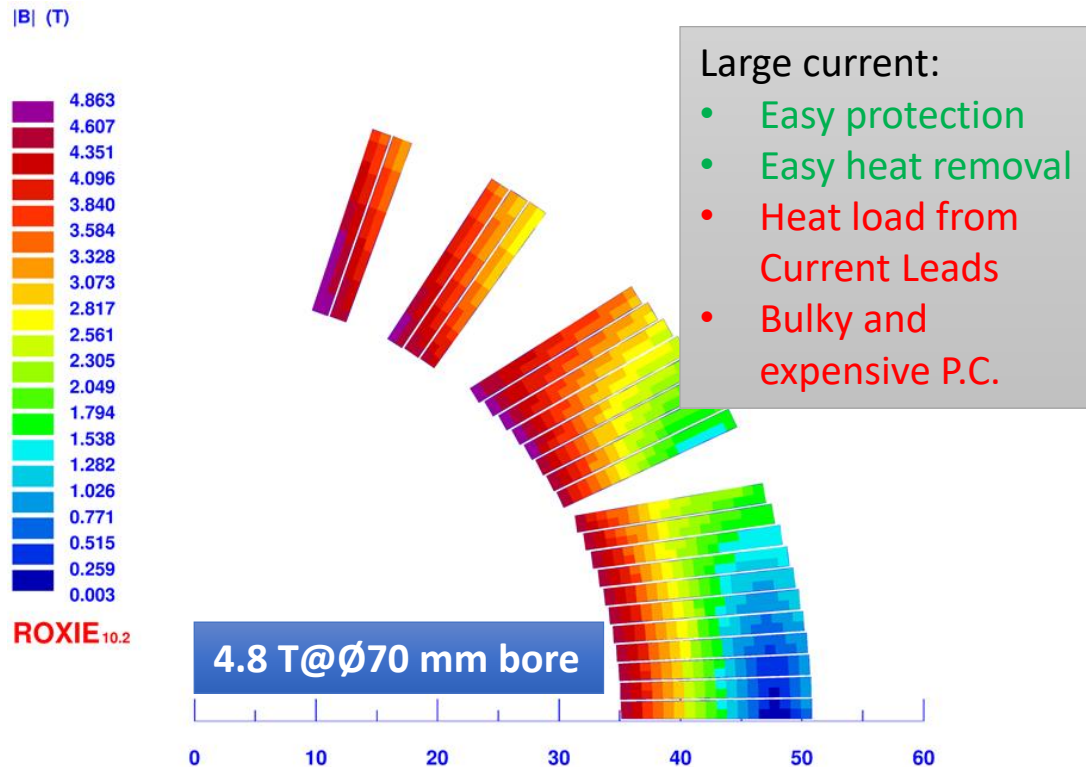

E. De Matteis and M. Prioli  
INFN-Milano-LASA

# Exploring the parameter space: $T_{op} = 4.7$ K 5 T@20% margin on load line; 70-90 mm bore; 1-2 layers

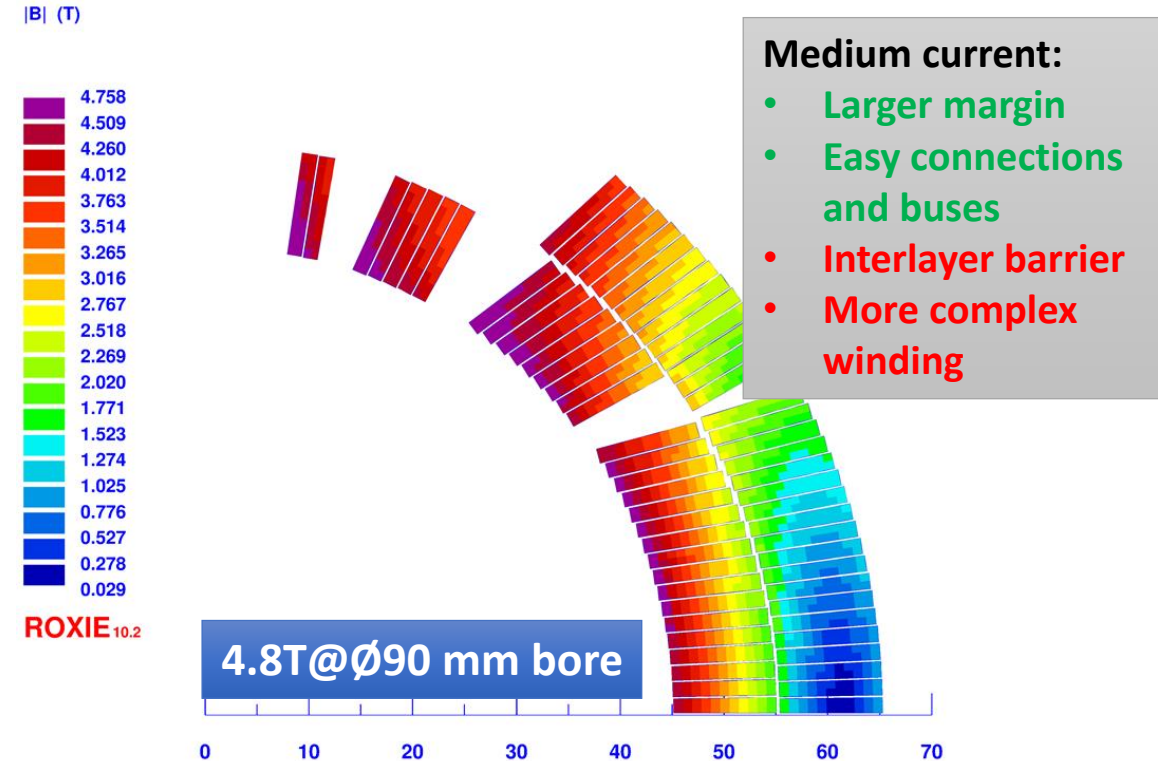

1 layer :  $\varnothing$ .825mm x 36 strands Ruther. cable (LHC02)

$I_{op} = 9.8 - 8.5$  kA (iron far-near coils);  $I_{op}/I_{ss} = 85\%-80\%$

2 layers :  $\varnothing$ .825mm x 22 strands Ruther. cable

$I_{op} = 4.6 - 4.0$  kA (iron far-near coils);  $I_{op}/I_{ss} = 76\%-72\%$

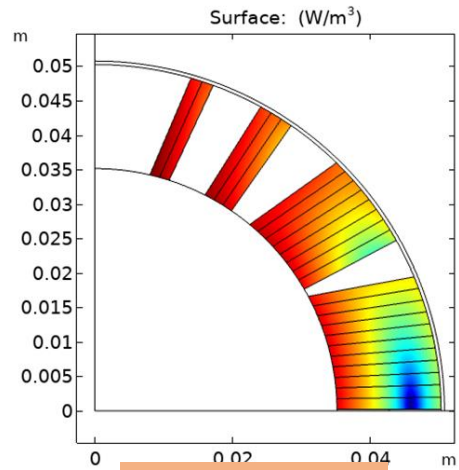

# Thermal studies: conductor losses only (no iron)

## Persistent, interfilament, interstrand (cored cable)

70 mm  
Cable 36 Strands

$dB/dt = 0.4 \text{ T/s}$   
 $B_0 = 0.45 \text{ T} \rightarrow 4.5 \text{ T}$

70 mm  
Cable 22 Strands

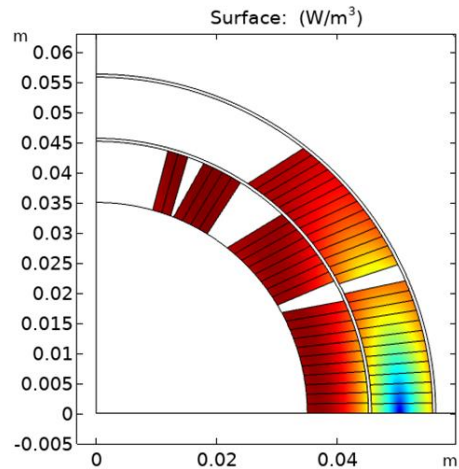

Persistent loss

IFCC loss

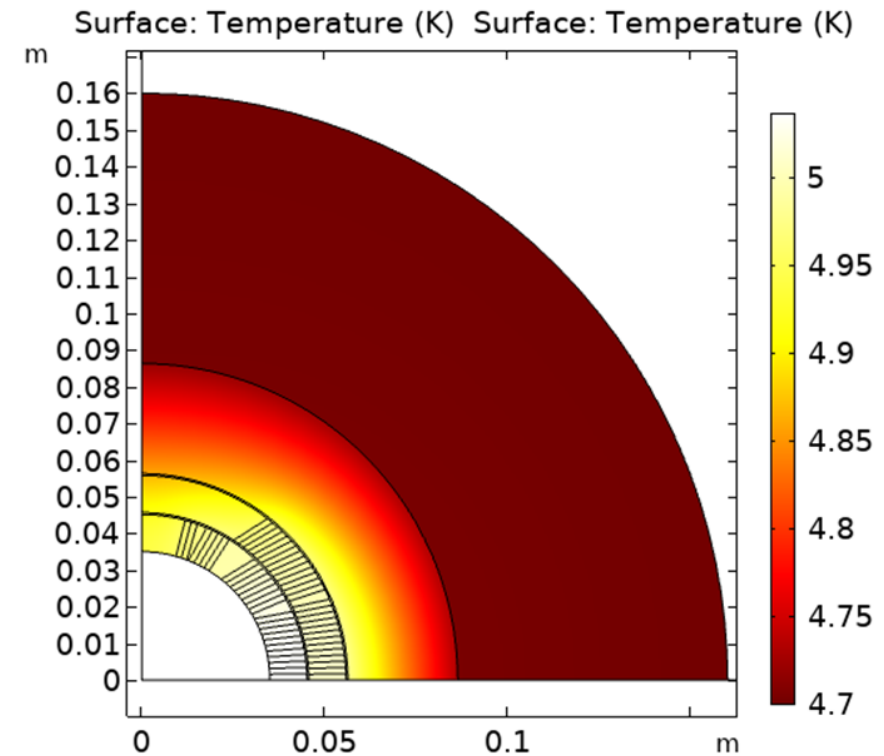

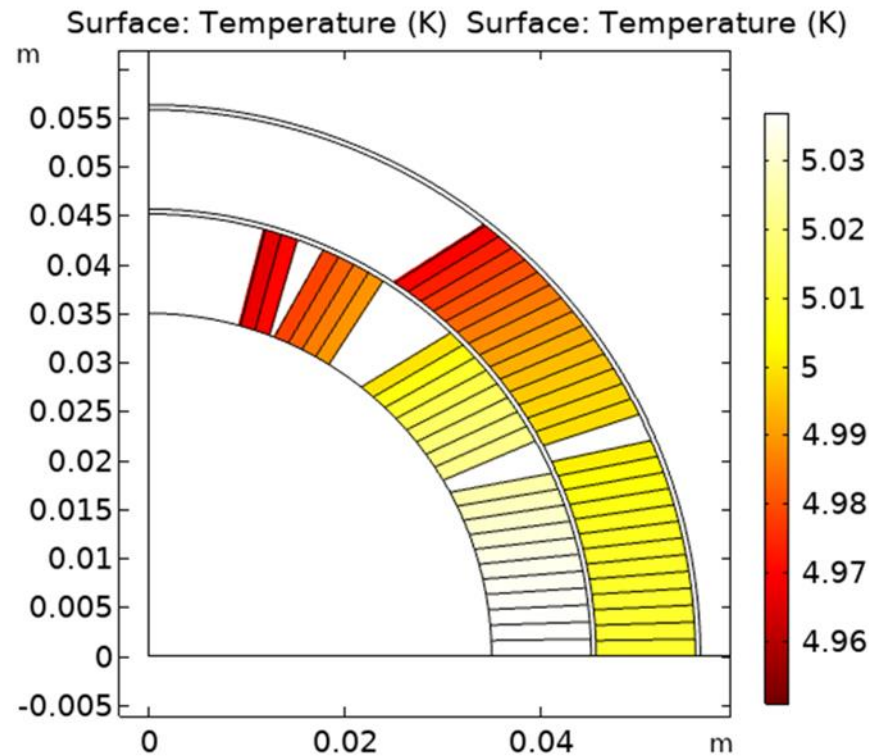

ISCC loss

# Thermal analysis, with far iron (30 mm collars) bottom line: 2 layers good!!

**Max coil temp is 5.04 K,  $\Delta T=340$  mK  
(+70 mK w.r.t. the single layer)**

**Highest thermal gradient in the thick  
stainless steel collar**

# Thermal analysis: reduction due to temperature increase of the Critical current density in the SC

$dB/dt = 0.4 \text{ T/s}$   
 $B_0 = 0.45 \text{ T} \rightarrow 4.5 \text{ T}$

- Min. value 1911 A/mm<sup>2</sup> reached in the pole turn:
- compared to 2088 A/mm<sup>2</sup> @ 4.7 K
- - 8% reduction of margin
- Despite the much higher losses in low field region, the limitation remains in the high-field zone
- **But very much acceptable!**

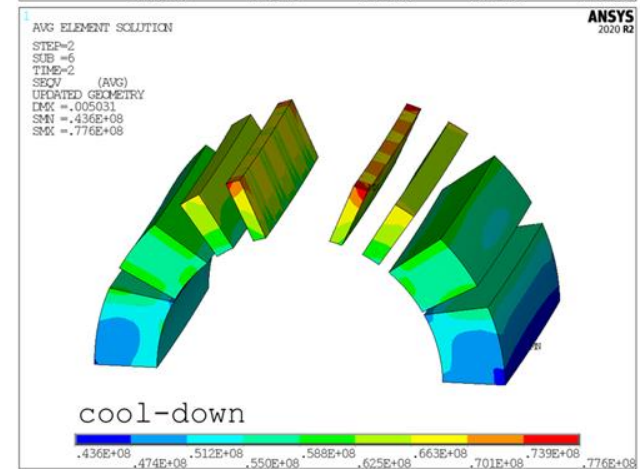

# Structural analysis:

1<sup>st</sup> collars as only force restrain – first done

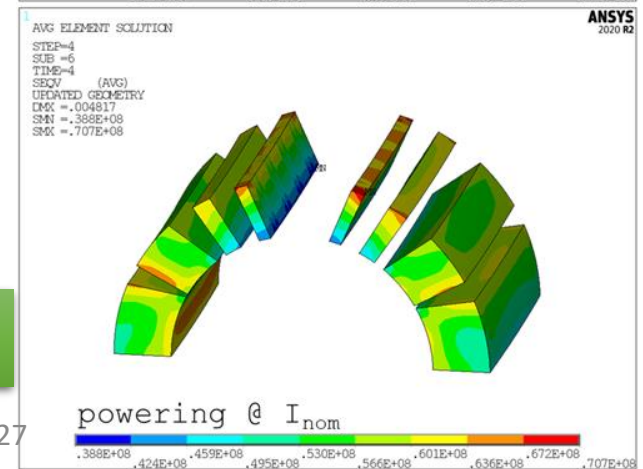

2<sup>nd</sup> : explore yoke support (like 3 T SIGRUM

100 MPa

80 MPa

70 MPa

Much more to be done but it looks we are in business ...

# Curved winding: the main issue for these “tubular magnets”

- We think this is the main issue in using accelerator magnet, tube-shaped, with strong curvature
- Exploring three methods
  - Convex-concave winding: proposed and tested by INFN-Ge for solid conductor (S. Farinon et al., IEEE-TAS, **14**, No. 2, p. 585, 2004
  - Concave direct winding with many winding posts (extension of DISCORAP)
  - A mixture of the two...

# Conclusion

- SIG project of INFN (Milano-LASA and Genova units) in collaboration with CNAO and CERN: 2022-mid 2025.
  - aim at a demonstrator dipole
    - $R_{\text{bend}} = 1.65 \text{ m}$
    - 30 deg with (about 1 m long)
    - **4-5 T dipole field**
    - 75 mm (70-90 mm)
    - **0.3-0.4 T/s** ramp rate
  - Final decision if to use the small cable-low amperage of first SGRUM design or these new ones will be soon taken
- The design of SGRUM gantry is under revision in view of the 4 T magnets
- Decision on the focussing system (nested quad, alternating combined function, etc..., is kept separated from the dipole demonstrator that will be a simple dipole maybe with a modest combined gradient. **Proof of curvature is essential!!**
