

Update of TL wall with inclusion of roughness

C. Zannini

TLwall

- TL based theory to calculate the resistive wall impedance of a multilayer round chamber
- TL equation can be applied recursively to take into account whatever number of layers.
- The code has been implemented in Matlab. A python version has been written by T. Rijoff. The code calculates the wall impedance of a round chamber loaded by a multilayer structure allowing for **PEC, Vacuum or Material boundary conditions.**
- The code was benchmarked with ReWall/IW2D.

TLwall: code for wall impedance calculations

Advantage

Flexibility, stability, Speed

Disadvantage

$|\epsilon_1 \mu_1| \gg \epsilon_0 \mu_0$

Surface roughness

Various profiles with the same R_a

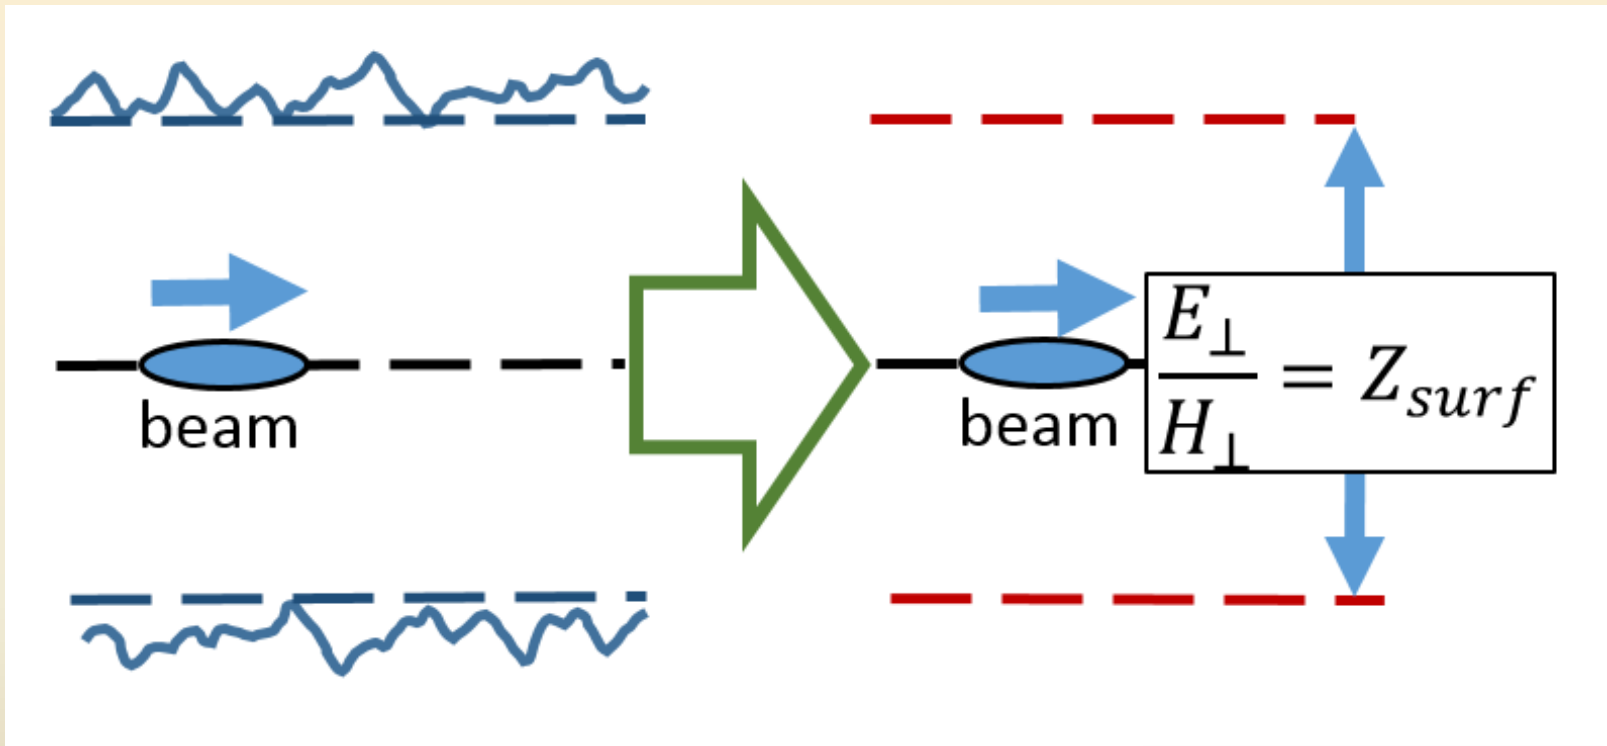

$$m = \frac{1}{L} \int_0^L z \, dx$$

$$R_a = \frac{1}{L} \int_0^L |z - m| \, dx$$

$$R_q^2 = \frac{1}{L} \int_0^L (z^2) \, dx$$

Inclusion of roughness in TL wall

$$R_s = \sqrt{\frac{\mu\omega}{2\sigma}} \left(1 + \frac{2}{\pi} \arctan(0.7\mu\omega\sigma R_Q^2) \right)$$

Hammerstadt model is also the default roughness model in CST

$$\sigma_{eff} = \frac{\pi f \mu_0}{R_s^2}$$

$$\zeta_1 = \frac{1 + j}{\sigma_{1eq}(\sigma_1) \delta_{1eq}(\sigma_1)}$$

$$\zeta_1 = \frac{1 + j}{\sigma_{1eq}(\sigma_{1eff}) \delta_{1eq}(\sigma_{1eff})}$$

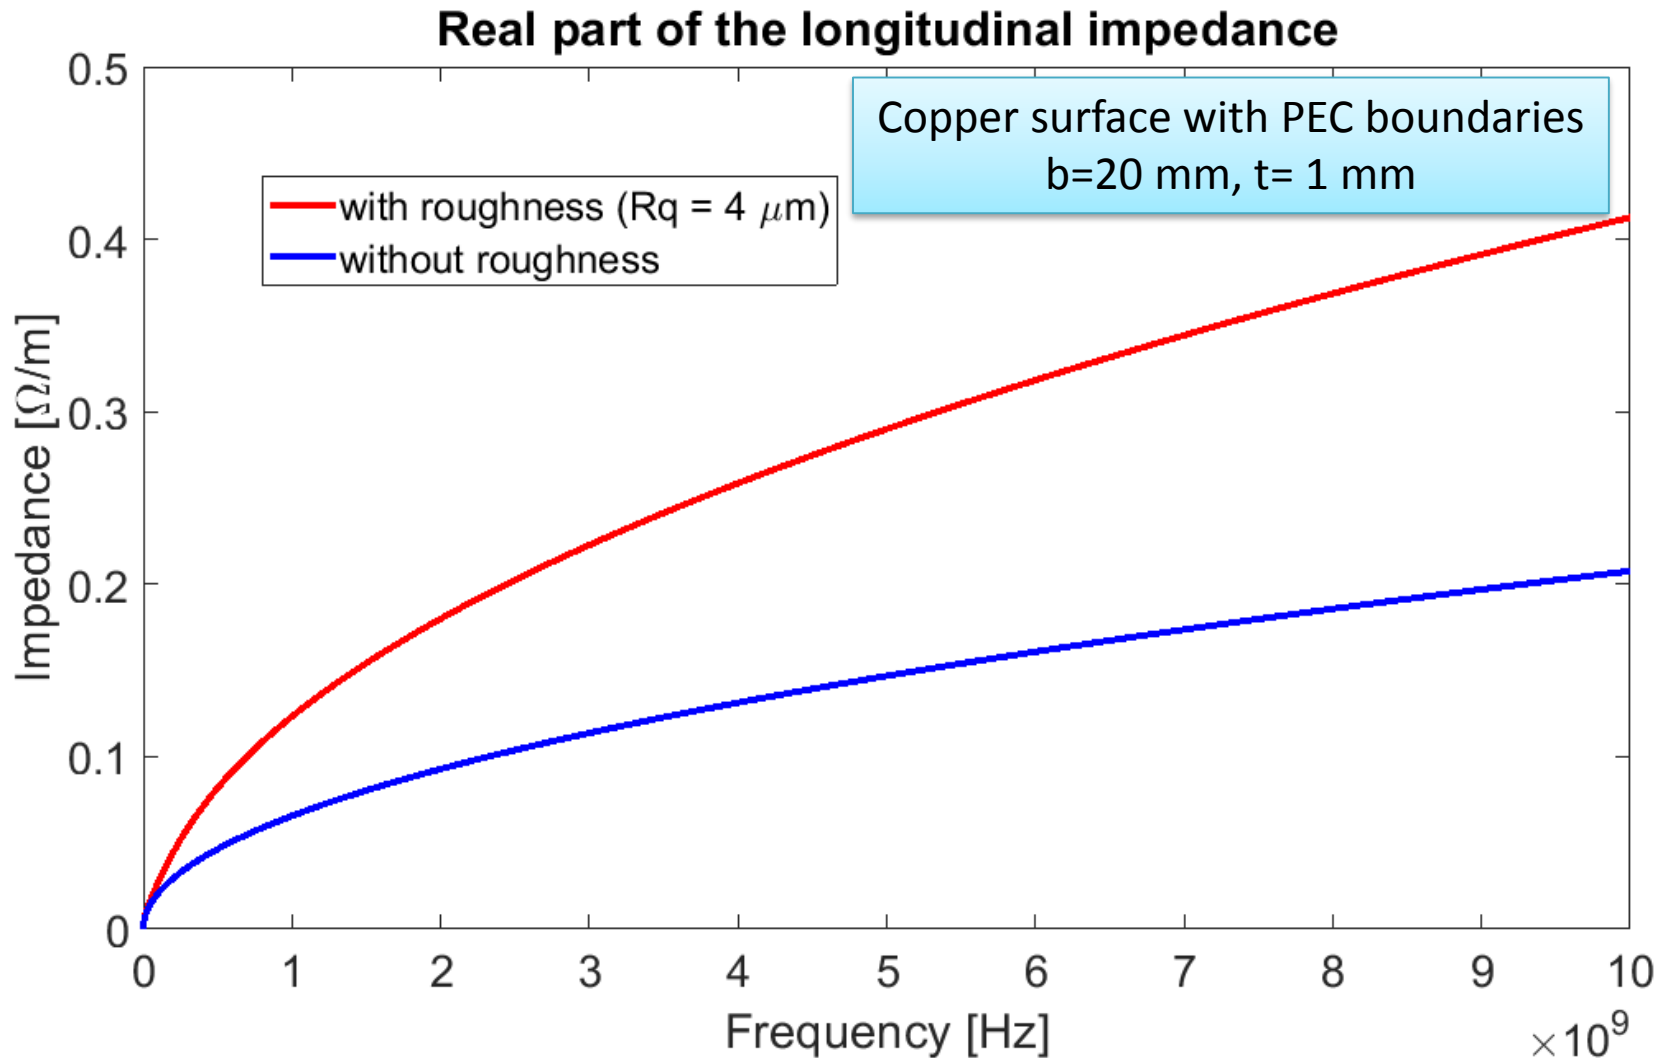

Complex equivalent conductivity

Complex penetration depth

More advanced models could be included using the same concept

Summary

- A Hammerstaad based roughness model has been included in Tlwall to modify the surface impedance of the first layer.
- The effect of the roughness on a test case has been found in good agreement with the CST
