

Carpenter (Gen. 2): SM18's test follow-up tool

Ioannis Koukovinis Platias (TE-MS-C-TF)

December 08 2020 for TE-MS-C seminar

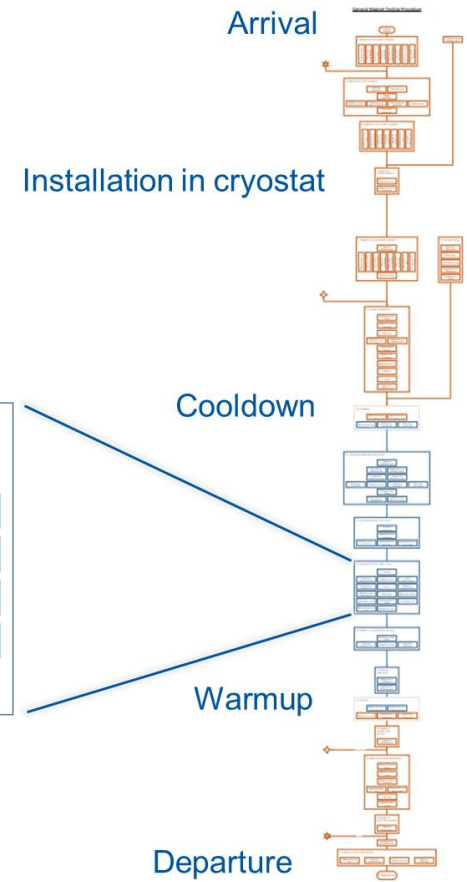

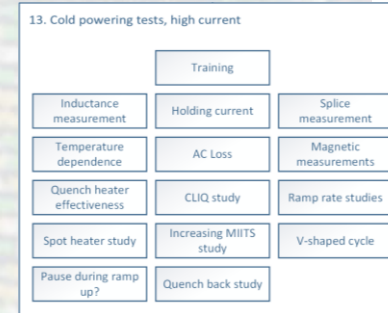

Magnet is a complex device

- Test facility needs input from other sections
 - Superconductor limits
 - Max allowed HV for insulation test
 - Magnet inductance
 - Details about powering (nominal current and ramp rate...)
 - Max hotspot temperature, quench integral
 - Magnet instrumentation
 - ...
- Many people interested in test progress and results

Testing is a complex process

- Between ~50-150 different activities to be done depending on item type
- Keep track of:
 - Magnet basic information
 - Testing setup
 - Test plan procedure
 - Activities done, not finished, problems, comments...
- Store measurements data
- Reports, tables, summaries

Carpenter solution

• Quality Assurance / Quality Control:

- Test progress tracking (who/when/what, results & events)
- Efficient communication between ourselves and with other groups
- Allow authorized users to see what we are doing

• Data processing and storage:

- Store data from selected activities (e.g. quench, HV test)
- Easy statistics and data filtering/mining
- Reporting options

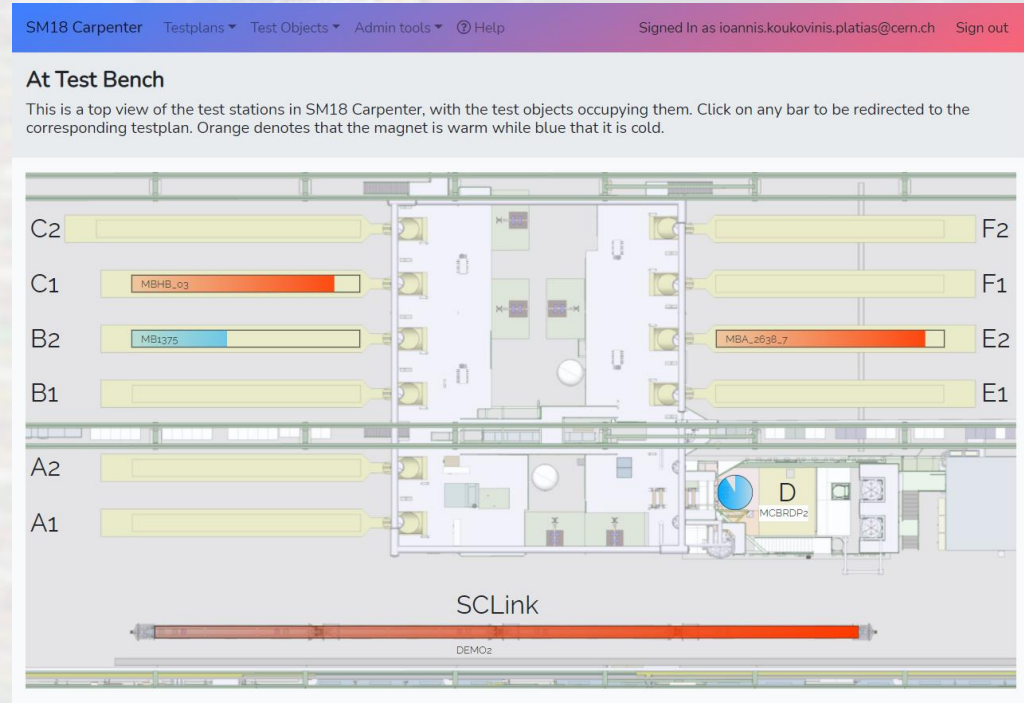

Table of contents

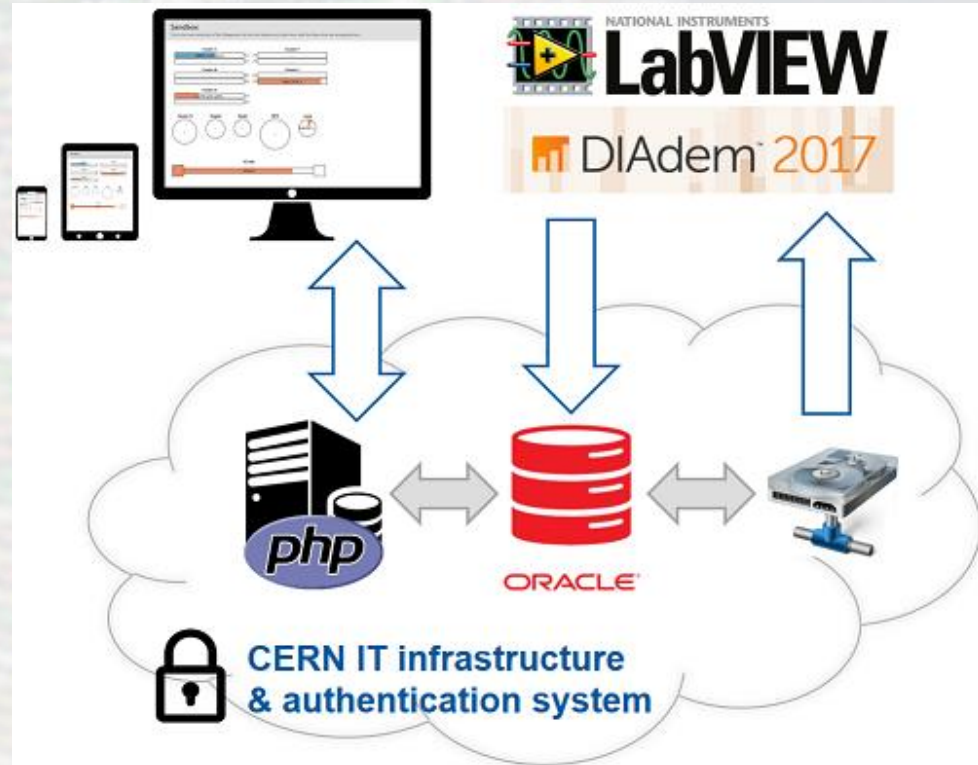

- Introduction to Carpenter
- What technology is behind Carpenter V2
- Carpenter V2 functionality and demonstration
- Next steps
- Summary
- Annex

Introduction

Carpenter ecosystem

- Main two parts of **Carpenter ecosystem**:
 - **Carvings DB**: Oracle Database
 - **Carpenter**: web interface to interact with Carvings DB
- Other DB access points: *OAQ, Wooden Bridge, Status board*

Carpenter Versions

• Version 1:

- In development from mid-2017 to Q1-2019 by two developers
- Entirely written in **PHP**
- **DFS-hosted** website
- Quick deployment
- Technical limitations on technology utilized due to DFS hosting (e.g. PHP v5.6 → no MVC framework can be utilized)
- Server not configurable
- Lack of standardization

The screenshot shows the 'SM18 Carpenter' interface with a 'Sandbox' section. The interface includes a navigation bar with 'Playground', 'Travel information', and 'Frequent flyers' options. The main content area displays a grid of test stations and items. Cluster C has stations C2 and C1. Cluster B has stations B2 and B1. Cluster A has stations A2 and A1. Cluster D has station MCBRDP1. Cluster E has stations E2 and E1, with E1 containing item MBA_2638_4. Cluster F has stations F2 and F1. Other items include Siegtal, Diode (Feather...), HFM, Long (MBHSP1...), and SLink (DEMO1).

Carpenter Versions

• Version 2 improvements:

- User friendliness: Highly interactive and mobile-friendly
- Feature-richness: Server totally configurable & expandable to current & future needs
- Standardization: Maintainability, ensures project's longevity

Welcome to SM18 Carpenter!

SM18 - The cryomagnets test facility

The SM18 facility at CERN is a world leading magnet test facility for testing magnets and instrumentation at low temperature (1.9 K up to 80 K) and up to high currents (20 kA). Due to its wide infrastructure and long expertise it has unique capabilities to carry out tests for instrumentation and superconducting magnets in vertical or horizontal test benches, as well as, magnetic measurements of all types of accelerator magnets.

You can still access the old SM18 Carpenter by clicking [here](#).

Contact: sm18.carpenter@cern.ch
Admins: Ioannis KOUKOVINIS PLATIAS (📞64567) , Franco Julio MANGIAROTTI (📞168286)

Technology

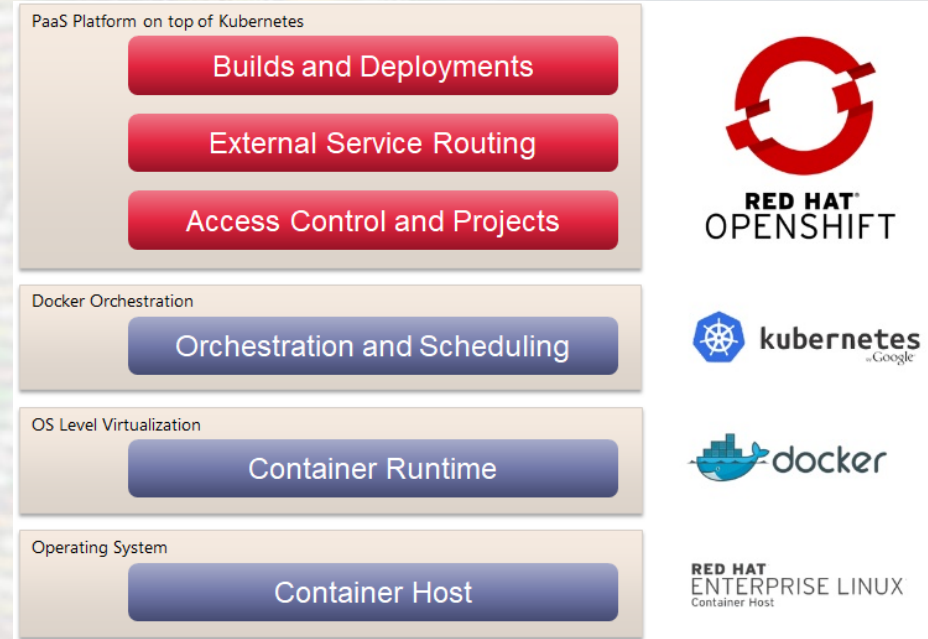

Web hosting options

	DFS hosting, EOS hosting	Sharepoint, Drupal, Social	PaaS/OpenShift	Openstack Virtual CENTOS7 Server
Pros	<ul style="list-style-type: none"> • Simple deployment (copy-paste) • Easy to setup CERN SSO 	<ul style="list-style-type: none"> • Simple setup • Straightforward development 	<ul style="list-style-type: none"> • Totally configurable and expandable • Easy to setup CERN SSO 	<ul style="list-style-type: none"> • Totally configurable and expandable • Total control of server
Cons	<ul style="list-style-type: none"> • PHP v5.6 • Server not really configurable 	<ul style="list-style-type: none"> • Limited options for customization 	<ul style="list-style-type: none"> • More complex setup 	<ul style="list-style-type: none"> • Responsibility to keep server running, safe and secure • Not easy to setup CERN SSO • Not officially supported

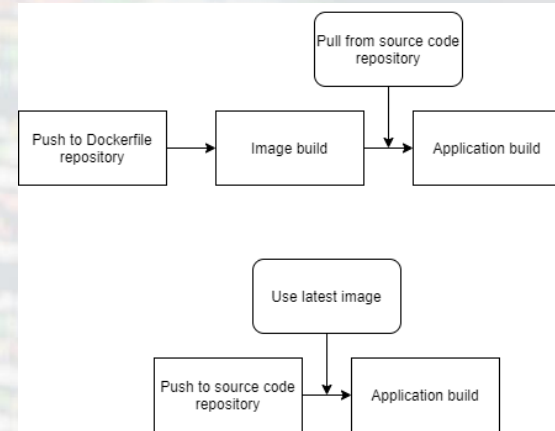

PaaS with OpenShift/Kubernetes/Docker

- **Docker** containers resemble Virtual Machines but are more lightweight, smaller and have better performance
- **Kubernetes** provides orchestration, scheduling, and management of Docker containers (e.g. auto-scaling, load distribution, failure protection)
- Simplistically put, **OpenShift** is a front-end management tool built on top of Kubernetes
- **Platform as a service (PaaS)** is a cloud computing model where a third-party provider delivers software tools (and even hardware) to users over the internet

Gitlab, CI/CD, CERN SSO

- **Two Gitlab repositories** used: one for the **Dockerfile** (system recipe) and another for the **Carpenter source code**
- Continuous Integration/Continuous Delivery (**CI/CD**) with **Gitlab Webhooks**:
 - A push to the Dockerfile repository triggers a new image (system) build. A successful image build triggers an application build using the latest commit to the source code repository
 - A push to the source code repository triggers a new application build (injecting newly-submitted source code), using the latest image as basis
 - If a new pod is successfully created, previous pods are terminated
- **CERN-SSO-PROXY:**
 - Builds and hosts a Docker image that provides an Apache reverse proxy that does Single Sign-On authentication
 - Acts as middleware for requests to our website → they pass through cern-ss-proxy pod before reaching our application pod
 - Flexible configuration

Frameworks and libraries

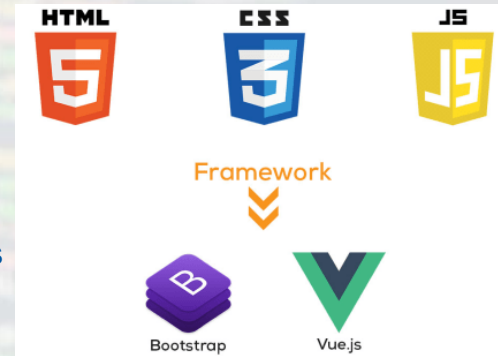

- **Back-end (server-side): Laravel (PHP)**

- Most popular PHP framework
- Follows the model–view–controller (**MVC**) architectural pattern
- Highly robust and secure
- Straightforward syntax and enforced project structure → maintainability
- Easy to install additional PHP & JS packages with included dependency management tools

- **Front-end (client-side): Bootstrap (CSS), Vue.js (JavaScript)**

- **Bootstrap** is the most popular CSS Framework for developing responsive and mobile-friendly websites
- **Vue.js** is a progressive front-end framework and one of most popular JS frameworks
- Reactive → makes state management simple and intuitive
- Both come pre-installed with Laravel → tight integration

- Various JS libraries like: jQuery, DataTables, handlebars.js, etc.

Overview

- Four categories in navigation bar:
 - **Testplans**
 - **Test Objects**
 - **Tools** (work in progress)
 - **Admin Tools**
- Interactive tables & links

vertical magnet: MBHSP109

Item Information	
Item owner: Frederic SAVARY	
HCMHSP001-CR000091 in MTF	
Number of apertures	1
Number of coils	2
Superconductor (1-Nb3Sn, 2-NbTi, 5-other)	1
Number of strands	40
Strand diameter	700e-6 m
Weight	4e3 kg
Diameter	560e-3 m
Length	2 m
Max allowed dT	150 K
Max stored energy	1e6 J
Maximum voltage @ 500K	1e3 V
Maximum voltage @ 4.5K	1e3 V
Low current Inductance	11e-3 H
High current Inductance	11e-3 H
Max quench integral	15e6 A ² s

Last updated by Franco Julio MANGIARDI on 26/11/2018 09:51:25

- Multiple magnets on one insert
- Stack of diodes
- Cryomodule assembly

Standalone test setup "SP109 in long"

Setup Information	
Quench antennas	7 #
Dump resistor	60e-3 Ohm
Strain gages	1 #
Power supply	20 kA
Quench heaters	4 #
Voltage taps	40 #
VT PotAIM cards	1 #

New Testplan Creation: MBHSP109 (SP109 in long)

Testplan General Information	
testplan name*	Cluster [v]
testplan engineer*	DUDA Victor [v]
testplan operator*	DESBIOLLES Vincent [v]
testplan edms #	
testplan comment	
testplan recipe name	
Testplan Activities Information	
Order & Activity Name	Special Instructions
*Magnet welcome	
L1.1 Magnet reception in SM18	<input checked="" type="checkbox"/>
*Magnet on stand, before cooldown	
L1.1 Define polarity	<input checked="" type="checkbox"/>
L1.1 Voltage taps continuity test	<input checked="" type="checkbox"/>
L1.1 Electrical insulation test	<input checked="" type="checkbox"/>
L1.1 Strain gages verification	<input checked="" type="checkbox"/>
L1.2 Fiber optic verification	<input type="checkbox"/>
L1.1 Quench heater resistance measurement	<input checked="" type="checkbox"/>
L1.2 Accelerometer/acoustic sensor installation	<input type="checkbox"/>
L1.3 Transfer function	<input type="checkbox"/>
L1.3 Capacitive discharge	<input type="checkbox"/>
*Magnet onto insert installation	
L1.2 Magnetic measurement shift installation	<input type="checkbox"/>
L1.1 Quench antenna installation	<input checked="" type="checkbox"/>
L1.1 Magnet installation in insert	<input checked="" type="checkbox"/>
L1.4 Mechanical check for maximum Strain Back-off status	<input type="checkbox"/>

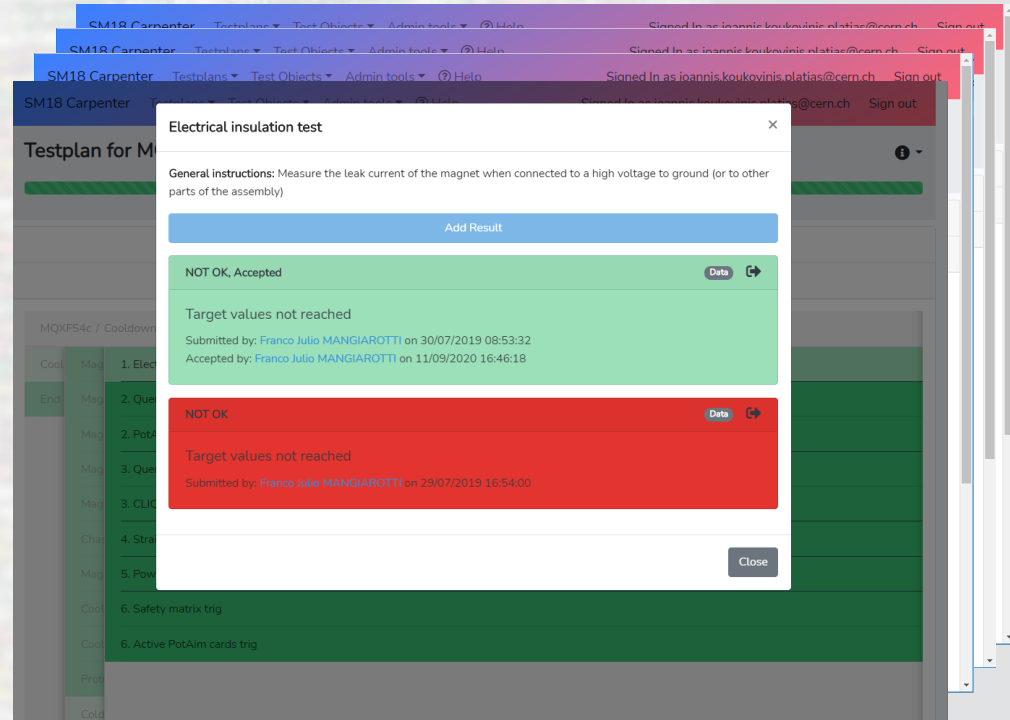

Interactive wizard

- Smallest unit: Assembly containing one or more Items
- Each Assembly needs to be assigned a Setup before a Testplan can be created
- Setup affects available/mandatory Testplan activities
- Form validation
- Recipes: pre-filled forms
- Available features depending on user permission level

Testplan view terms

- A Testplan can consist of more than one **Cooldowns**
- Each Cooldown consists of **Steps**, which are a collection of related **Activities**
- **Results** can be added to activities
- Depending on the activity, the **result type varies** from simple checkbox to values from a list, to input fields/file input or both
- Results have a **result status** and an **acceptance status** (e.g. it might be desirable to accept a result even though it failed)
- Multiple results can be added to an activity until one is “Accepted”

Archetypes

- Some activities can save values from input fields or values parsed from uploaded files
- The idea of **Archetypes** allows grouping of fields based on the activity type
- Nothing is hardcoded, archetypes fetched dynamically → flexible solution, makes adapting to new requirements easy
- Same idea applied to many tables used throughout the website

The image shows a screenshot of a web application interface for an 'Electrical insulation test' and a corresponding database schema diagram.

Form Screenshot:

- Title: Electrical insulation test
- Buttons: Add Result, Upload File, Add results manually
- Fields: Ambient Humidity [%], Ambient Temperature [K], Item Temperature [K], Device name
- Table of results:

Polarity Pos	Polarity Neg	Voltage [V]	Duration [s]	Final current [A]	Resistance [Ohm]	Capacitance [F]
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

- Date: 02/11/2020 18:38:15
- Comment: Enter comment
- Buttons: Not OK, OK, repeat, OK, finished
- Close button

Database Schema Diagram:

- CVG_TESTPLAN_ACTIVITY_RES_OUT**
 - F * TESTPLAN_ACTIVITY_RES_ID NUMBER
 - F * ARCHETYPE_OUTPUT_ID NUMBER
 - TESTPLAN_ACT_RES_OUT_GROUP NUMBER
 - TESTPLAN_ACT_RES_OUT_VALUE VARCHAR2 (100)
 - CVG_TESTPLAN_ACTIVITY_R_O_FK1 (TESTPLAN_ACTIVITY_RES_ID)
 - CVG_TESTPLAN_ACTIVITY_R_O_FK2 (ARCHETYPE_OUTPUT_ID)
- CVG_ARCHETYPE_OUTPUT**
 - P * ARCHETYPE_OUTPUT_ID NUMBER
 - F * ARCHETYPE_ID NUMBER
 - ARCHETYPE_OUTPUT_NAME VARCHAR2 (50)
 - ARCHETYPE_OUTPUT_UNIT VARCHAR2 (10)
 - ARCHETYPE_OUTPUT_GROUP NUMBER
 - ARCHETYPE_OUTPUT_MLT CHAR (1)
 - CVG_ARCHETYPE_OUTPUT_PK (ARCHETYPE_OUTPUT_ID)
 - CVG_ARCHETYPE_OUTPUT_FK1 (ARCHETYPE_ID)
- CVG_STEP_ACTIVITY_FK1 (ARCHETYPE_ID)**
- CVG_STEP_ACTIVITY_FK3 (USER_PRIVILEGE_ID)**
- CVG_STEP_ACTIVITY_FK4 (ASSEMBLY_EQP_ID)**

Testplan view

- Test progress tracking:
 - Hierarchical structure to guide and follow the test
 - Only test engineer and operators can input data
 - Keeps track of what has been done, when, by whom
- Data Storage:
 - Loaded files from analysis software are automatically parsed
- Smart features like:
 - Result submission control
 - Multi-value entries
 - User notification

Events

- **Two types:**
 - Breakpoint
 - Information
- **Breakpoint Events** prevent new results submission until resolved
- **Information Events** are simply for informational purposes

Tools

- Data filtering/mining (existing in V1, work in progress in V2)
 - Data can be filtered and then downloaded for further offline analysis
 - Future: statistics, training plots, etc.

Data Archetypes

- HV test
- Resistance
- RRR
- Quench
- Hold current
- Inductance
- AC Loss
- V-I
- Diode endurance
- Diode reverse

Next steps

- Release Version 2 officially
- Reach 100% functionality of Version 1
- Advanced statistics and visualizations
- Automatic report generation / report filtering
- + more new features

Summary

- Carpenter is SM18's test follow-up tool able to:
 - Track test progress (who/when/what, results & events)
 - Retrieve a wealth of information
 - Add new/edit entries to Carvings database
 - Filter and retrieve data
 - Inform members
- Built with modern technology ensuring:
 - User-friendliness
 - Rich features
 - Maintainability and project longevity

Questions / Comments

Annex

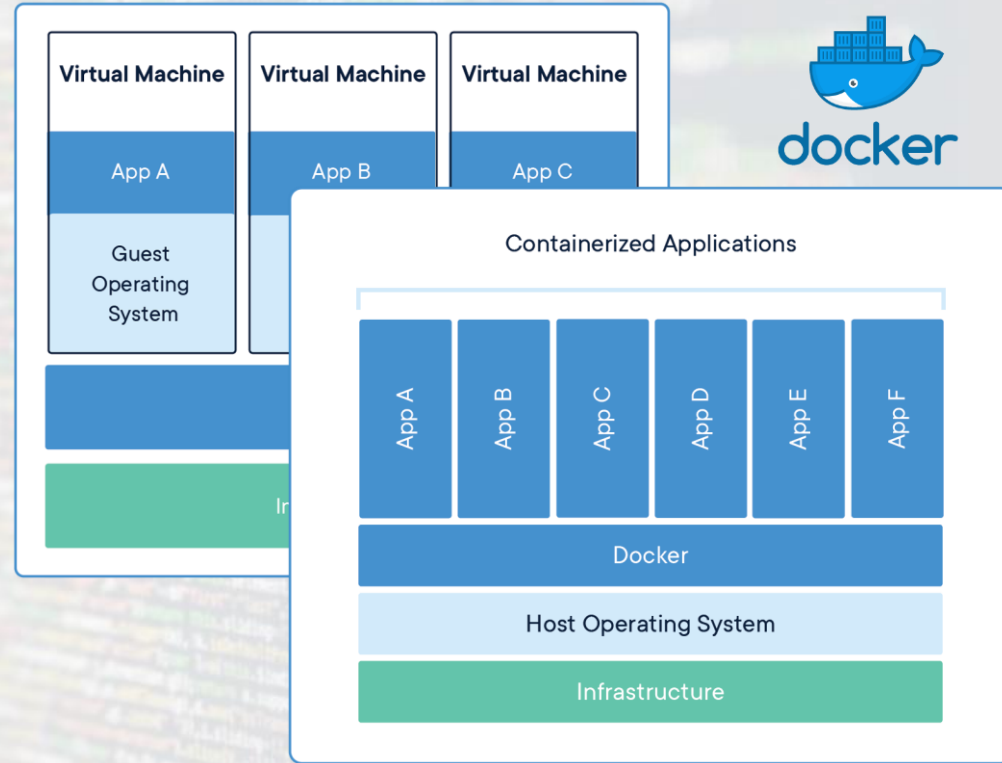

PaaS with OpenShift/Kubernetes/Docker

- **Platform as a service (PaaS)** is a complete development and deployment environment in the cloud
- Red Hat **OpenShift** is a PaaS for organizations that deploy and manage OpenShift on their own on-premises hardware or on the infrastructure of a certified cloud provider
- OpenShift is built on top of **Kubernetes**
- **Kubernetes** orchestrates Docker containers

What is Docker

- Docker provides containerization at the OS level (a bit like a virtual machine)
- Unlike a virtual machine, rather than creating a whole virtual operating system, Docker allows applications to use the same Linux kernel as the system that they're running on and only requires applications be shipped with things not already running on the host computer → similar to VMs but more lightweight
- Significant performance boost
- Reduces the size of the application
- Docker Containers = Containerized Apps

What is Kubernetes

- Kubernetes is an open source container orchestration solution, providing orchestration, scheduling, and management of Docker containers
- Kubernetes manages groups of containers called clusters.
- Auto-scales containers
- Distributes load between containers
- Manages storage required by containers
- Provides resiliency of containers in case of failure

kubernetes

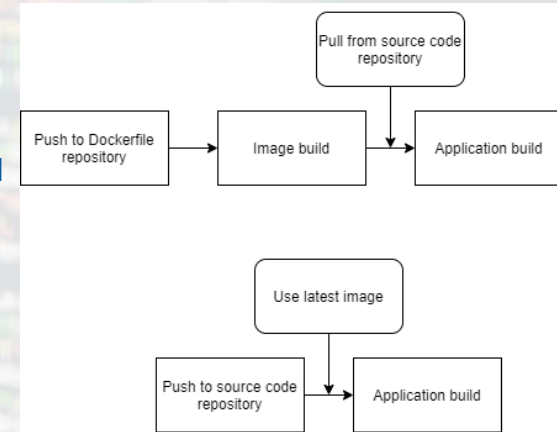

What is OpenShift

- OpenShift is a PaaS solution by Red Hat built upon Kubernetes and Docker projects, adding deployment, orchestration and routing functionality on top of container scheduling and management provided by the Kubernetes core
- Provides developers with an integrated development environment (IDE) for building and deploying Docker-formatted containers, and then managing them with the open source Kubernetes container orchestration platform → simplistically put, OpenShift is a front-end management tool built on top of Kubernetes

Gitlab Webhooks & CI/CD

- **Two Gitlab repositories** used: one for the **Dockerfile** and another for the **Carpenter source code**
- Docker can build images automatically by reading the instructions from a **Dockerfile**. A Dockerfile is a text document that contains all the commands a user could call on the command line to assemble an image
- Continuous Integration/Continuous Delivery (**CI/CD**) with **Gitlab Webhooks**:
 - A push to the Dockerfile repository triggers a new image (system) build. A successful image build triggers an application build using the latest commit to the source code repository
 - A push to the source code repository triggers a new application build (injecting newly-submitted source code), using the latest image as basis
 - Our application is an instance of the application build, called an OpenShift pod
 - If a new pod is successfully created, previous pods are terminated

Adding CERN SSO

- The **CERN SSO** (Single Sign-On) service allows Web based applications to authenticate users and retrieve their information including their group membership to manage authorizations
- **CERN-SSO-PROXY:**
 - A SSO authenticating proxy for OpenShift applications
 - Builds and hosts a Docker image that provides an Apache reverse proxy that does Single Sign-On authentication
 - Acts as middleware for requests to our website → they pass through cern-ss-proxy pod before reaching our application pod
 - Flexible configuration

What is Laravel Framework

- **Laravel** is a free, open-source PHP web framework based on Symfony intended for the development of web applications
- Most popular PHP framework
- Follows the model–view–controller (**MVC**) architectural pattern
- Has its own templating language called **Blade** to create HTML layouts
- Comes with **Composer**, a PHP dependency management tool, as well as **NPM**, used to manage JavaScript dependencies → easy to add functionalities by installing additional packages
- Highly robust and secure
- Straightforward syntax and enforced project structure → maintainability

Bootstrap, Vue.js + additional JavaScript packages

- **Bootstrap** is the most popular CSS Framework for developing responsive and mobile-first websites
- Comes with Laravel → tight integration
- **Vue.js** is an open-source model–view–viewmodel (MVVM) front end JavaScript framework for building user interfaces
- Incrementally adoptable → can be integrated into existing projects or exclusively used to power Single-Page Applications
- Reactive → makes state management simple and intuitive
- Many more JavaScript packages used, like: jQuery, DataTables, handlebars.js, etc.
