Higher-Order Cumulants of Net-Proton Multiplicity Distributions from RHIC-STAR

Tuesday 18 May 2021 11:30 (20 minutes)

In the study of QCD phase structure and search of the QCD phase boundary and critical point, higher-order cumulants of conserved quantities are proposed as promising observables and have been studied extensively both experimentally and theoretically. For 4^{th} -order cumulants it is predicted that there will be a non-monotonic energy dependence trend. For 5^{th} - and 6^{th} -order cumulants results from Lattice calculations suggest that they are connected to the smooth crossover transition at $\mu_B = 0$. At high baryon density region, on the other hand, the higher-order cumulants are also sensitive to the first-order phase boundary.

In this talk, we will present net-proton cumulants up to 6^{th} -order in Au+Au collisions at $\sqrt{s_{NN}} = 7.7 - 200$ from STAR Beam Energy Scan phase I and $\sqrt{s} = 200$ GeV p+p collisions. Analysis update on STAR fixed target energy $\sqrt{s_{NN}} = 3$ GeV will also be shown. Physics implication as well as comparisons with various models will be discussed.
