RD51 –WG7

Tentative August and October setups

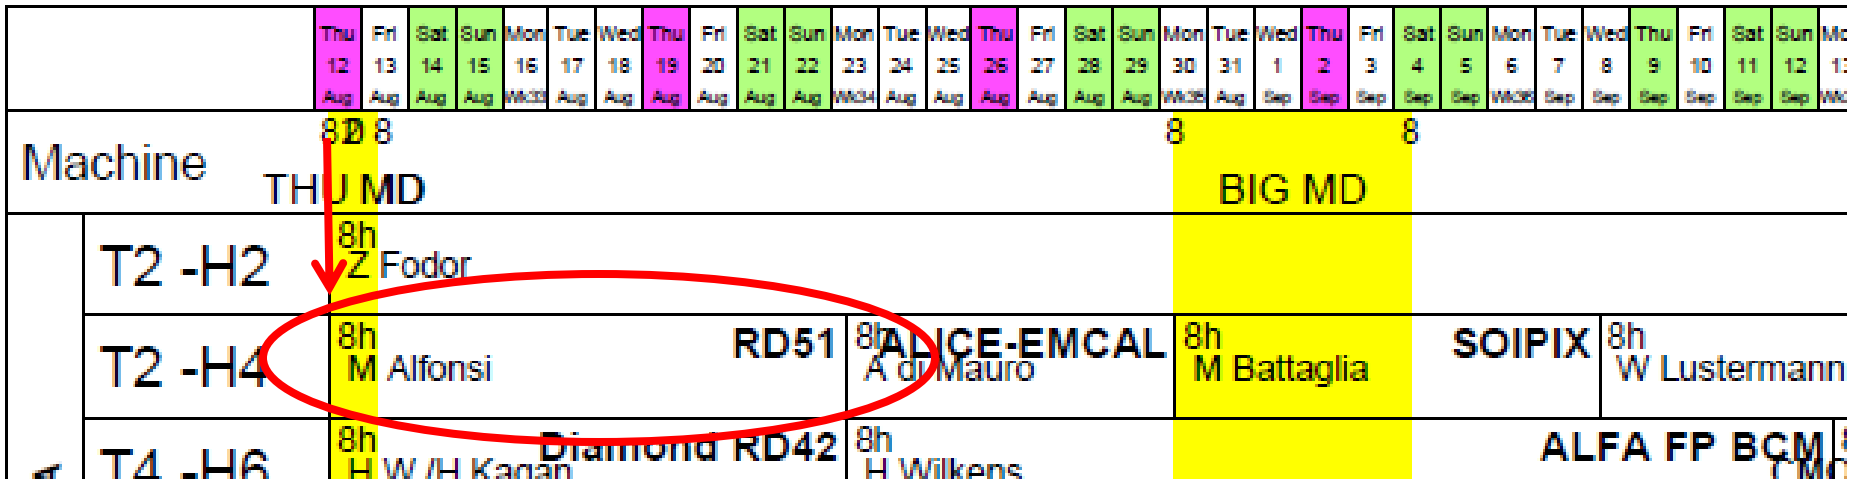
Matteo Alfonsi

August test beam schedule

SPS Operation

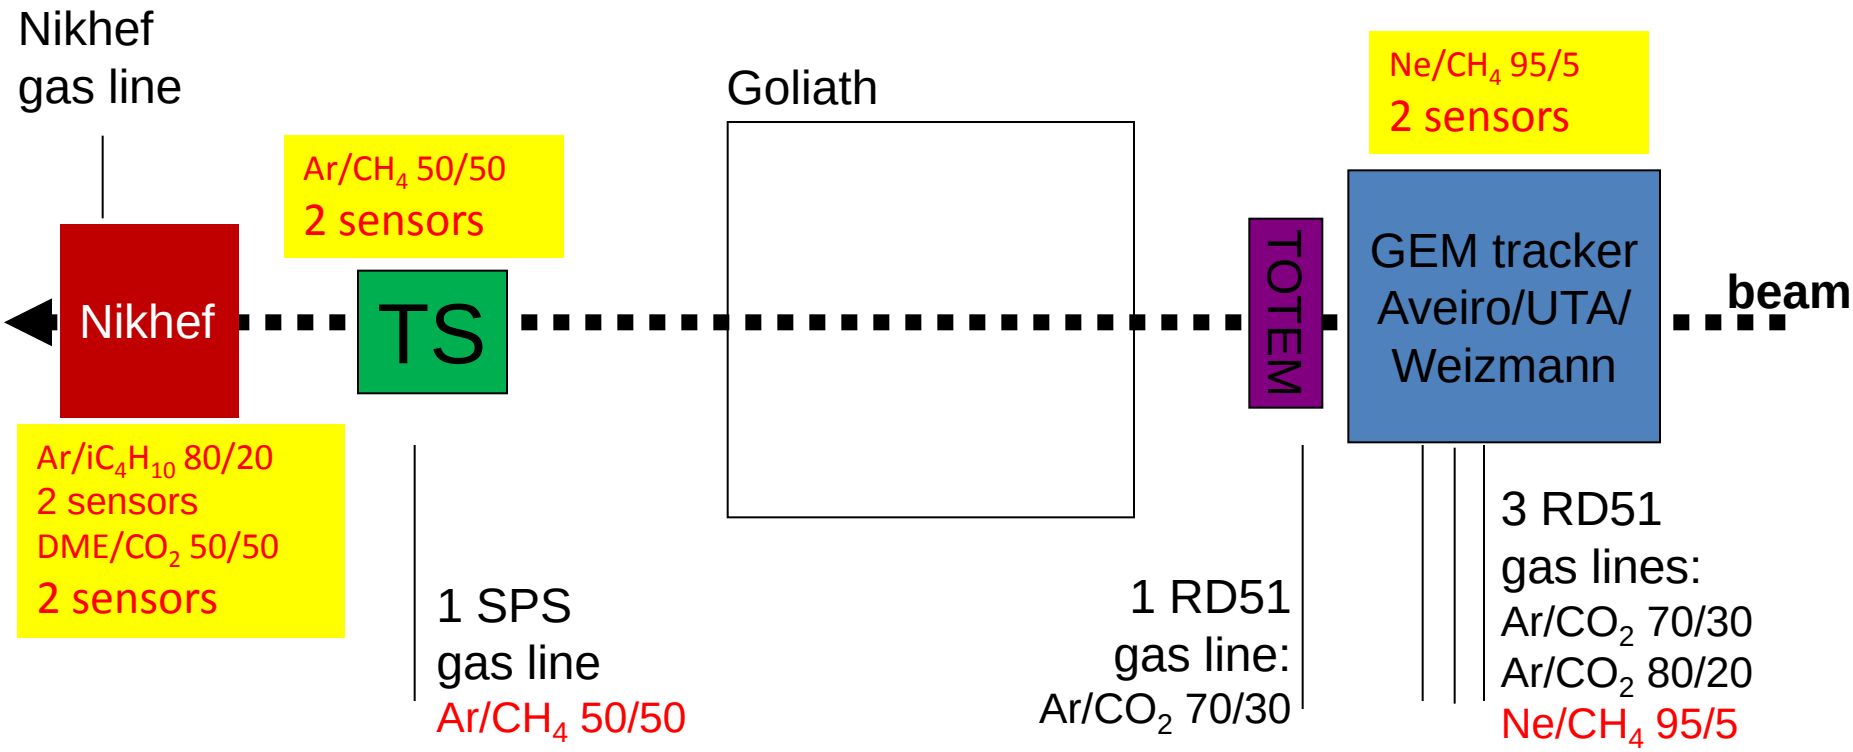
Period 4 2010 Aug 12 to Sep 16

Schedule issue date: 14-July-2010 Version 2.0 (colour code: purple (dark) = scheduling meeting , light green (light) = wee



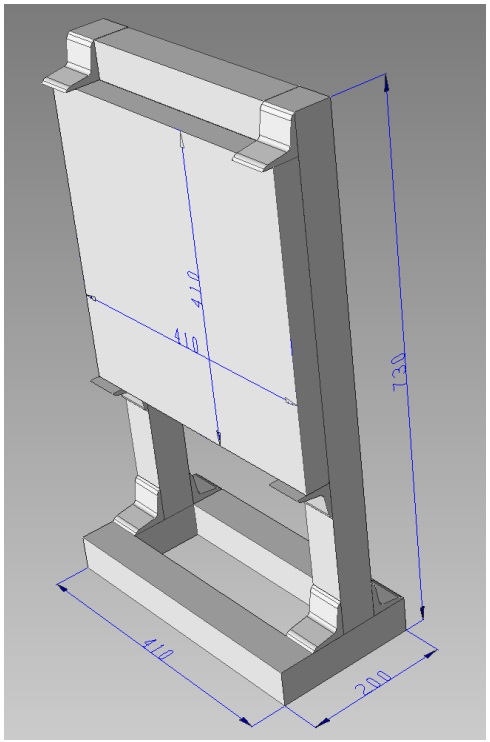
- Start 12th of August
- First day of MD.. No problem because of installation
- 10.5 effective days

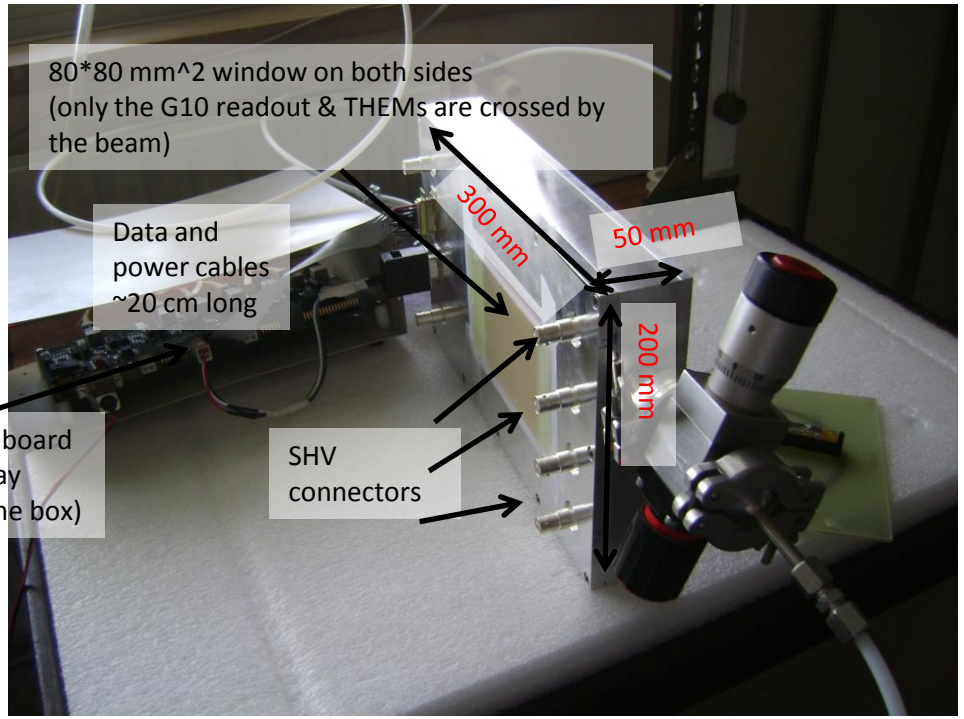
Period 2 (August 12th – 23rd)



No magnet, but several flammable gas

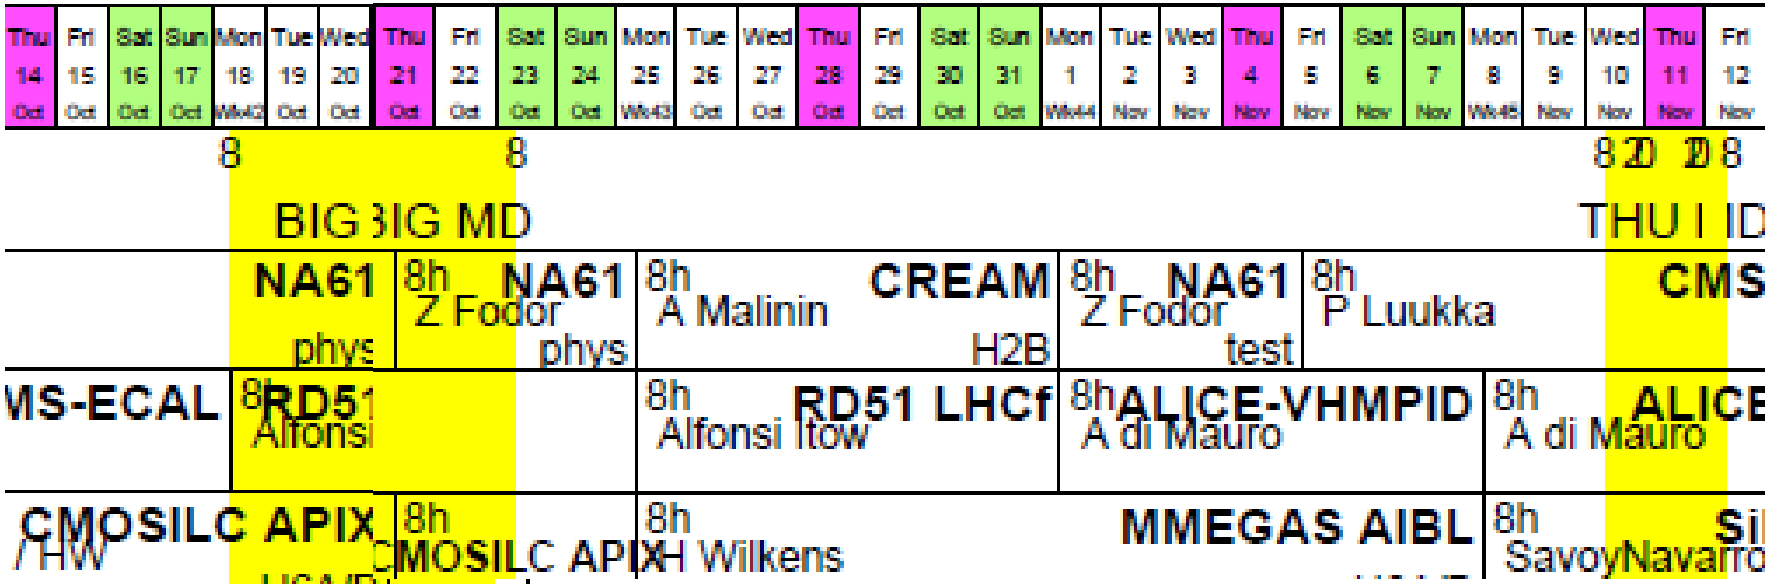
Aveiro/UTA/Weizmann setup within CERN table





Compatible within CERN table if these dimensions includes the whole envelope with services

Problems in October



- Big MD at the beginning .. Useful for installation but only 9 effective days for 7 foreseen groups
- SPS coordinator wants to put LHCf parassitically in our period: space in the area should be enough, but I see big problems with accesses, beam settings, space in the barrack
- Safety requested an updated fringe field map.

Conclusions

- No major problems in August setup
- New Goliath fringe field measurements required for October (possible slot: end of August)
- LHCf within October test beam is a major issue
