

Metadata: Point of View of Physics

SHORTLIST

Borut Paul Kerševan, Junji Toyo

Shortlist

- Requirement:
 - ▶ 'Entry point' for all metadata should be unified.
 - ▶ One should be able to navigate to all essential metadata related to a dataset.
 - ▶ MDTF document should be updated and kept as a 'live' document: Complex analysis use cases should be the source of feature improvements in interaction with AMI.
 - In particular we need to define a procedure to include new metadata in the framework.
- Implementation issues:
 - ▶ Usability of user interfaces should be improved in interaction with dedicated contact person(s) appointed by the physics community.
- We need a Metadata System Architect who will be in charge of implementing all the requirements and the way how the metadata will be aggregated and integrated with Monitoring, ProdSys, DDM and DA (=ADC activities).
 - ▶ The balance between aggregation and integration is a technical task which needs doing (COOL vs AMI etc..).
