

# META-DATA ISSUES IN DA

- Source for info for number of events per inputfile needed for job splitting or input/output verification - source of info AMI or DQ2 ?
- Output validation/bookkeeping: have all files been processed ?
- Where to store meta-data for user output data-sets ?
- Store (some) user output in AMI ? Go through group production ?
- Grid related: Job brokering info, job statistics, error classification, dataset popularity
- Currently no `metadata.xml` produced for user jobs
- GRL handling via xml files looks to be solved
