Experiment use cases for altsecurityidentities in XLDAP service

- CERN IT, as part of the MALT project, is revisiting the usage of the LDAP service while trying to make sure they don't break functionality for anyone.
- Part of the existing information (like group memberships) will be available through new REST APIs and some will still be available through an LDAP service.
- CERN, right now, also offers an interface to register and stores external certificate DNs for its users. Which are exposed through LDAP.
- This info will be removed from LDAP. Knowing that experiments use this info we need to identify:
  - Other services that use this information.
  - An alternative way to store this information and make it available to the experiments.
